#### Industrial Democracy and Engineering

m page 264) becoming known as the industrial en-

It might not be amus here to give definition of just what an industrial en-gineer is. This we will attempt, but wish to point out, of course, that the pro-

wish to point our, or course, that the pro-fession still relatively new, is not yet en-tirely standardized and the following definition can only be offered as one of several existing. The industrial engineer several existing The industrial ongineer is an individual who, by training, experience education and personal attributes is qualified to study the problems of organization personnel, equipment, buildings and all features of management and ings and in teatures of management ac-control in industrial of commercial or-ganizations (an analyze present condi-tions apply rejudies where necessary, improvements when possible and, finally establish standards which are acceptable, practical and permanent

To those interested, we suggest an examinution of the principles which have been developed by this group of engineers Underlying all their activities will be found a distinct realization of the definite establishment of properly functioning leaders and a plan providing for all those factors mentioned in the forepart of this article as scooped for a correct industrial article as accepted for a correct industrial plan. During the time that the thought of this group has been developing, and probably more especially during the last five or six years more and more the realization has come that any plan of realization has come that any pian on industrial control which does not provide an acceptable basis to each and every human factor and individual involved cannot stand for long and, honce, they have be to making considerable strates in the stady of the human problem and its many and warred sails. Standing as he many and varied sides. Standing as he does in so many cases between the capitalist and the worker the industrial engineer has become in a sense the coordinator, and it is hoped can more and more fulfill the function to the complete satisfaction of both the other groups

All this we believe will be found to prove our case that the industrial engineer our case that the industrial engineer whether intentionally or otherwise matters little has been definitely and steadily making progress toward the fundamentals of an industrial democracy and should be found a very important factor not only in the industrial readjustments and reconstruction immediately before us, in the next great step in advance that of establishing a permanent industrial democ racy. We believe the industrial engineer in this country is one of the real dyed-in-the wool industrial democrats

In any case we know that this group consisting not only of industrial manage and executives, but specialists, and con-sultants as well as educators and research students has dedicated itself to this work and we feel sure that as a result of the work done heret fore and with this as a basis for its future activities will be found in the end a very active coordinating influence with a lutions ready for the many intricate problems involved. Much has been done and now with the large opportunities ahead the next several years will see a well recognised accomplishment in these fields

arrive at the Bronx, they must be transferred to glass houses of their own in which are duplicates of their respective environ are duplicates of their respective duvisors ments in the sections from which they came Daily they must be closely in spected. If any disease develops among em, they must have the same immediate and careful midical or surgical attendance the same experienced nursing and feeding as manl and As a miscellaneous collection of reptiles they are not merely rubl necked by the million of spectators who by large classes of students from the high schools and higher institutions as an exsential part of their curriculums, and their respective poses are of interest to several thousand would-be artists

One of the commonest diseases at the Reptile House is cancer It is especially prevalent among the anacondas and next the boss. When it starts among the condas, all of that tribe usually go by the board A huge python was recently attacked, but the disease was diagnosed in attacked, but the disease was diagnosed in time and the life of the great snake, 23 time and the life of the great snake, 25 feet long was saved She was recently attacked by ticks, but prompt efforts ridded her of these enemies and again her 12-year old life was spared At this writing, she is shedding her skin and two ulcers have been observed under the new uleers can be removed and her life again 16 men to hold this great reptile objects most stronuously to being handled Artists and spectators generally regard this python as the most beautifully colored antinul extant. Her colorings are superband blend into each other like the weave of a costly rug Boss are usually attacked by cancer on the tail the disease working upward Anacondas are usually attacked in the floor of the mouth the disease soon enveloping the whole skull. A speed, symptom is the falling out of the teeth Camer according to the government commission which investigated it, unless sereditary, can only be caused in human or lower animals by eating some animal or lower animals by eating some animal that has it. If the person or lower animal has immunity he escapes. If, however the cancer germ finds a weak spot in the intestines favorable for breeding, cancer intestines favorable for breeding, cancer results. The breeding process us so slow that the disease is usually not recognized until too late to treat it. In that respect it resembles the growth of some of the lowest fungi and probably belongs to that or n near order of plants. According to the commission noted the cancer germ is the below of the commission noted the cancer germ is attached to certain species of algae in fresh water The plant is apparently most has raged for some years among trout and nas raged for some years among trout and salmon, particularly at the hatcheries Ones the germ gots into the hatcheries, it is hard to eradicate (see government work on (arcinoma))

Mo die has recently traced cancer back to the rentiles of the Carboniferous Age era of coal formation from plants the era of coul formation from plants fossis of many reptiles of the coal era show that their derms: was caused by cancer I may have originated still sarker on earth, but there are as yet mi-older fossis to prov it. In Carboun-ferous prind casted some 15,000,000 years ago. The animals (reptiles) of the years ago The animals (reptiles) of the successors Fossils of every age since show the ravages of cancer and other dis In fact, it is doubtful if any dis ease exists in modern times, not prevalent almost since the beginning of life on earth

convicting them; so they took no pains to give us what was soming to us, and laughed at any claims we might try to make. The inspertion system stopped this loss, and more than that it enabled us to give ou sustantian the goods and the service that they wanted and hadn't been getting Similarly in the tallow transaction al

andy referred to, we found that by sup plying photographs of the shipment, with weight a certificates and chemist s certifi cates of quality we could give service and get prices that were quite out of the ques-

tion without these additional service frills. But if you are aske in spring the buyer double measure in documents, photographs and other incidentals, beware of strying to sure, bits more than he asks for an goods. I its of lases crop up where, to save a little time or a fittle trouble, or to insmust; himself into the good graces of the foreign buyer, the exporter ships a better article than the one ordered, billing better artist than the one ordered, billing it of course at the price of the cheaper goods. Don't do this your customer knows letter than you do what he wanta, and why, and if he doesn't get what he orders he doesn't have to accept the

One such case was an order for rough boards for flooring. The edges were to be tongued and grooved, but the surfaces unplaned. The lumber mill said they would have to make a special run of the order which would cost more than to sell the planed goods at the price of the rough So we shipped the planed lumber-and presently we received a bill for \$400 representing the customs differential on planed boards as against rough In another case we shipped an improved chemical reagent only to find that our ustom r had no faculties for using this in place of the older and poorer one he had been coupleying to of course he refused to pay first. These represent but two to pay fr it These represent but two
of n my possible reasons why your
cust mucrs may insist on getting the poorer
quality that they ordered in preference to
the better quality that you tried to wish

(50 tons) and verified this suspicion before shipping. Perhaps he would have paid for the 1 000 tons, certainly we would have had a lot of argument and some bad feeling if we had shipped it and tried to collect If we not shipped it and tried to collect Another Latin sent us an order for gloves intended as a gift to the President of his Republic the total value of his order would have been around \$2,000 We handled this case differently We sent him four pairs made to order after his specifications at a cost of some \$20, and we told him that the balance of the order would follow upon notification that these were eatisfactory. Of course he rose to this saturdatory () course acrose to this series. A fundament is wince to prove the course of the plant is written series in his behalf, and stating that he off before ever the plant is used, followed would let use know if more were wanted by 10 per cent a year for the next five years, I his was a lot better than shapping him his is no bouncess for a layman, but that is whole order and then trying to get his what the ship-owners have to do

Speaking of money—it takes a lot of it to swing a Nouth American export business The Latin is a notorous proorestimator, and no less so when it comes to paying than in other respects. He will demand long terms and when his account falls due he terms and when his account falls due he may pay and he may not But make no metake about this, he will pay, eventually Debts long past due, im many cases out-lawed and writin off, have been paid in full. There seems to be something at the blood of these Spanish peoples that pre-vents their ever forgatting a just debt. If the man who contexted it is so suffice. the man who contracted it sees unfoot [selfowing one gives for tunate as to be unable to pay, consbedly the will I recall one case, from Salvador, you where a debt of several thousand dellars middlenant, for everyth contracted by a father was paid by the son since fitten years after it had been charged off as a total loss.

Another point to be considered in the climate of the contracted by the contract of the c

question of hanguage. A sum our around the world, for planeaus and finglish all the time; blanch desse it. But if he goes to sail goods, of our must know the hanguage of his of Portugees in Brazil, Spanish slew; the Americas—or be distanced by h petitors I think even the m when they send a man to a foreign country, he must speak the language of that country But that is by no means all that the language amounts. language amounts to
Your customers in this part of the wor

speak Spanish while they are communing your goods, as well as while ordering them Pherefore anything that you may have to say to them in their capacity of consumers must be said in Spanish—or in Portuguese This includes instructions for setting up and This includes instructions for setting up and operating it includes encipes, it includes lots of things that each exporter must think of for himself, and which will constitute a separate problem for each article exported Moreover, your customers are going to order in Spanish, not in English Unless great care is also, in translation, heavy

losses will result One order sent to New York read 1,000 canas sebe para manas, and referred to pure mutton tallow to be burned in the miners lamps. The clerk in the New York office translate in the New 107K omee translated this 1,000 cases grease for mines, instead of lesslow and what is known as cup grease for lubricating was shipped. The goods went around the Horn to Antofagasta and over two ranges of the Andes to the mines in Bolivia, before the error was discovered In Bolivia, octors the error was cusouvered.

Then, of course the shipment was refused, and somebody paid a loss of \$20 000 for bad translation. This would have hired a competent translator for several years, and the case mentioned is not an extreme one. because the excessive costs of shipping to the interior of South America make any

the interior or south America make any error necessarily an expensive one I would extend a word of caution to the export middleman who looks forward to the day when he will salip in his own bottoms. In my opinion there is no busithe first of the same price.

The the other hand if your cleant has involving an obvious marks it will pay you viscole. It is a business best left in the use the cable to correct it. When on, hand of specialists I can recall several sustems or ordered 1000 tons of wheat we have hand to the meant 1000 quintals in the Signers, and one where the deficit supported that he meant 1000 quintals in the Signers, and one where the deficit. came close to seven places. And these were not kitings, but enterprises that had sufficiently favorable outlook to induce the investment of large sums by hard headed business men nor were the cases to which I refer due to war conditions—they are taken from normal times before the war taken from normal times before the war Strikes, secoledate, plaques, coal and oil shortages, wrecks, market changes, turned the favorable prospects into lugge losses Unless you can support such losses without being eruppled, pay the freight that is asked by those who can support them, and be happy that you can avoid them on any target. A business in whole 15 car series terms A business in which 15 per cent of the invested value of the plant is written

> When a firm grows large enough to do a general exporting business it should have ignoral exporting bissiness it should have (not necessarily on its salary list, but et its call), a firm of expert industrial chemies, an up-to-date architect, a mechanical engineer, an expect on steamers, a live-stock broker or vetarinary—in fact, a man who can handle any attustion that ean conceivably area, and some that could not possibly be preconselved. One mail helagy an amounty for a prison an superson bridge to span a tropical viver; the next savelage to span a tropical viver; the next savelage copans the subject of a tronsessed for the staughter of your closet confess slient, the Hellowing one gives forth an erder for a sughter of your oldest coffee stient, a fellowing one gives forth an erder for thoroughned Holstein bull and six sor You will be milled upon, as an engine middlenast, for swaything froup a needing an anchor, a freight leasted to give a memory, and it every instance, and many manual read ready and after to give a memory and after the standard ready and after the

#### Future of British Flying (Continued from page 259)

the Hun could not be beaten without he was beaten in the air and that the only way to beat him was to outbuild him These or many of them, at least will see a mose or many or usem, as seast will seek the causets path, which will not be that of watting for flying to grow to their eapselty but that of resuming their pre-war status Some engine factories will turn their facilities to other things than simplane zootors and many as workwomen, if not a more than a will resture from summer than a workwomen, if not a resign from construction rk to go to home building But with work to go to home building. But with the finatural shrinkage canouraged, the re-maining industry which wants to remain in the air industry as going to be larger than unprompted civilian demands can sup-port. Her fore easy the government ownership unbussat. It the government take over the whole industry and run at any does the thermals and the post office. as it does the telegraph and the post office

But the men in the industry will have none of it! They don't want to sell out to the government or to become a part of a monog hy Let the government help us while we need it say they, 'but let it keep its hands off ownership'

Luckily (it is easy to see what conclusion the writer has adopted as his own!) the powers that already are in the Air Ministry are against government monopoly of civilian flying Lord Wier Secretary of State for the Royal Air Force says I am convin ed that cooperation between the activities of the state and the activities of the private firms will produce the finest The state must be the pioneer it must help it must encourage it must guide it must exercise control—but emphatically it must not monopolise

What will probably happen will be that the state will be eventually to civil aerial mayigation much what it is to civil mariful transportation at the present time luglands mercantile marine is time i indiand s mercanium manne in rigidis held to certain standards by law A ship in ist not load above her plimad mark his must pass an inspection for seaworthiness. Her master and her pulot her enguer and her under officers, must have certificates of computancy She can do no thing when she carries fraight and mu h less as she pleases when she experiments with human life as passengers Her courses are marked on government charts guided by government lights and buovs and wor betide the master who goes the wrong side of the buoy or true for his the wolle and of the budy of true for all harbor against regulations as to hour and tide. But the state which demands all this which pays a mail rate to mail steamers and helps build certain huge liners that they may constitute a part of the navy in time of war makes no attempt

tae may in time of war makes no attempt to carry either passenger or freight.

This idea seems to be that which is generally held as practical regarding the coming a riral transport system. Of the mechanical difficulties no one over here makes any fuss. With planes which can land at a fixed gliding angle automatically and with directional wireless the landing and it have gaming angue accountably the last year or more of the rat and a similar control with the same part of the same pa port as the lack of governmental sites for airdrumes—amil that of course can be overn. The course of the overn. The course of th

All these questions have been taken up

Transport Committee, and presented with force and effect from both sides. Just what the government will do, or when it will do it, no one knows. That it will do something, and that soon, and that in one something, and that secon, and that in one way or another England in particular as well as the Empire in general, is about on the threshold of the greatest ample trans-portation effort of her national life cannot but be obvious to any one who sees on the one hand a mighty industry, on the other government determined to have an ampire government determined to have an empire reconstructed in every way, and particularly in an economic way and, standing between, the blat legal, social, technical, political and economic brains of the empire, all best on deviaing the best way in which the country can make the best use of her war-forged industry!

In t it about time we of the United States began to ask ourselves what we are going to do with our mighty airplane in-dustry and what part our government is going to play in our development of our civil aerial transport besides establishing a few airplane mail routes?

#### The New York Aeronautical Exposition

THE whole story of aviation is told at the New York Aeronautical Exposition eld in New York City from March 1st to 15th Not only are there to be found all the well-known airplanes of the war, with such familiar names as the De Havilland-Four, Caproni, Spad, Curtiss flying boats S. E.-5, Nieuport, Fokker and Handlev-Page, but also the forerunners of the coming era of civilian flying One leaves the I xposition with a dased sense of the recent sdvances made in aviation, even if one has

been a pretty close student of the subject With the signing of the armistice the various late belligerents have naturally disclosed their heretofore closely guarded secreta. So the exposition is replete with fighting machines about which we have read so much in the recent past. Such is a read so much in the recent past. Such its a more or less battle-worn Spad bipliane which is mysteriously canuschaged in palar gross and chocolate brown, a Britash S. E. with its curously hinged Lewis gun over the top plane, and a Baby Nieuport with its rotary engine planely showing behind the fractor strew. Then there are a second of the plane is not been sent to the second of 
Then there are the planes developed in America toward the closing days of the highting, and which were never brought to bear on the Germans Typical of such machines is the Loening monoplane with its queer deep belied body simple struts and amater black coat over all. This machine despite its unconventional deagn has broken numerous records and promised to be a vertiable terror if it ever promned to be a veritable herror if it ever reached the front here is also the Gleen Martin bomber a twin-engined plans with a span of over 100 feet—which was developed too late to be used against the enemy. This plane compares favorably with the Handley-Page which was cx tensively used for bombing purposes during

the last year or more of the war All the war machines bristle with naturally so, for there is certain to be more interest in a machine that has seen agrees than in one that was to see assube any dian't

disn't
There is no end to the war re

# MAJOR-GENERAL LEONARD WOOD

NOW WRITING FOR THE

# **METROPOLITAN**

The Metropolitan Magazine feels honored to be able to announce that beginning with the April issue Major-General Wood will be a regular contributor to its pages. With anarchy and the unloosed passions of men pounding on the very doors of civilization, the principles of uncompromised Americanism will find a staunch defender and an able interpreter in General Wood. It is particularly fitting that the constructive and liberal program for the future laid down by Colonel Roosevelt in the Metropolitan should be developed by one whose long and intimate association with the Colonel promises a ready sympathy.

The constructive ability of General Wood in personally drawing up and creating a democratic constitution for Free Cuba placed him among the great Americans of our generation; and not only in America, but throughout the civilized world Leonard Wood's work in Cuba has been recognized as one of the finest achievements of modern democracy.

Major-General Leonard Wood

## **Drop-Forgings** vs. Castings

WHEN a manufacturer builds up a reputa-tion for his product through long years of hard, conscientious work, anything that tends to detract from that jealously guarded reputation cannot be tolerated for an instant If a part in the product of such a manufacturer proves defective, he is not satisfied with mere replace ment, the future must be considered and assur ance against recurrence of the trouble provided

Perhaps a casting has given way resulting in a bad accident—an accident which never would have occurred had the part which failed been a drop forging with its wonderful toughness and high tensile strength

Dependable forgings cost more than unreliable cast ings but the additional expense involved in their use is never a serious factor in consideration of the manufacturer determined to make only the best

And if forgings are to be used, Williams Superior Drop Forgings, with a record of nearly half a century of creditable performance offer you the reliability and dependability which you are seeking

### The answer to your questions about the cost of meat!

Send for Swift & Company's 1919 Year Book. Get facts and figures about America's most supply that eve one should understand. Write for it now-sent free

Why is the price of meat so high?

Do the packers control it? What has the war had to do with it?

How was the American army fed?

Why are the prices of butter and eggs so high?

Are the packers responsible for the high price of shoes? What are the real facts revesled by the Federal Trade Commission's investigation of the packing industry

Swift & Company's Year Book shown above, will give the answers

to these and many other interesting questions about your greatest food problem Write for it now.

There is no mystery in the mes packing business It operates under conditions of intense competition and, like every other industry, is controlled by fundamental business principles

This Year Book presents a review of Swift & Company's opera-tions during 1918 and shows that the profits earned (about 2 cents on each dollar of meat sales) were too small to have any noticeable effect on live stock and mest prices.

Send us your name for this valuable book now sent free-a postal will do.

# You, Mr. Property Owner, are responsible for America's appalling fire waste

You owe it to yourself and to the community to preserve intact that portion of the country's wealth entrusted to your care.

Will you do your part? The Hartford Fire Insurance Company is able and willing to help you.

A well-organized and sound insurance company has two functions:

- To co-operate with its policy-holders so that they may avoid loss.
- 2. To indemnify them for unavoidable

The "Hartford" gives both forms of service It will co-operate by giving you expert advice on the following and other topics having to do with the avoidance or minimizing of loss. It will tell you

- 1 How to build safely
- 2 How to guard against the dangers inherent to your business.
- 3 How to arrange your plant so as to prevent serious interruption by a small fire
- 4 How to establish a system of care and maintenance which will make for safety
- How to select and install the most suitable apparatus for promptly extinguishing fires if they occur

These suggestions will be supplemented by visits from engineers and inspectors who will help to maintain proper conditions. But the responsibility rests with you

AS TO INDEMNITY The "Hartford" offers the guarantee of its reputation for commercial honor built up during 109 years of faithful service This guarantee is backed by assets of over \$40,000,000

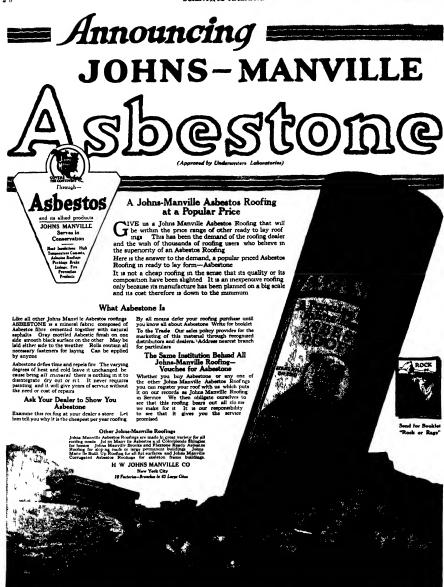

It solicits an opportunity to co-operate with property owners who realize their responsibility and are willing to enter into a mutually helpful relationship

Any agent or broker can get you a policy in the

# To Solve the Battle-Cruiser Problem

HE approunce ment that the Secretary of the Navy has ordered a suspension of work on the six 15 kn it buttle-crimers which had been nuthor ised but not built brings to our nunds the battlecruser controvers, which raged so fiercely made and cutsule the Navy Department some two years ago The thice year program of 1916 called for these ships they were to make good a scrious gap in our basal defenses for at that time we had no battle-cruisers whatspeyer The British had sompleted the Repulse Renown 800 foot ships of 110 000 horse power and 12 knot speed mounting six 15-inch guns and pur naval constructors produced plans for a very remarkable ship far outstripping the Renown in all points of comparison. The new battle crussers were to be 875 feet long they were to make 35 knots with 180 000 horse power and werd to mount ten 14-inch guns The ships were to be equipped with the electric drive

the plans called for the placing of 12 out of the 24 boilers above the protective deck presumably because with such a huge horse power as 180 000 there was not room for them below dock. As our readers will remember the Sciencial American entered an earnest protest against these ships on the grounds that because f their exposed position these boilers would be put out of action when the enemy got the range. Our objection to the ships was a military one for we knew that no captain would wish to carry his ship into action with such a heavy handicap upon it. Our protest was largely instrumental in bringing about a reconsideration of the designs and the latest plans for these ships called for placing the whole of the boiler plant below the protective deck. Although the delay due to these changes seemed at the time regretable it now appears that it was most fortunate for the lessons taught by the war point to the abandonment of both the lightlyarmored buttle cruiser and the super-armored battlewhile in favor of a compromise type in which the distribution of displacement between gun armor motive power ammunition and berthing accommodation is to te arranged on the principle of give and take new type of slap has only one element which will not be interfered with and that is the provision of comfortable living quarters for officers and men for the p reconnel is far and away the most important element in the making of a well-found lighting ship

the British have abready adopted this compromise typ and the first of six closes the Hood is meaning complete. This ship may be called a high-speed bett ship or a howely amond lattle crusser just as a cycles. See will carry eight 15 mile riftes with 1 til slip amon 2 find be within 12 mile a thickness and will 1 cc speed of 30 to 31 knots. Her displacement

There is the sent opinion among our navel officers and as usual the choices of a broader, less convictional me price search with the about the befound among those the result have been already and as timely engaged in the present was which the more to necreative attitude as to be found in the General Board and among those officers who have been only the numerator in the characteristics.

there of the Secretary - Thus in favor of a compromes ship are Admiral Suns, Admir il Senson, and Admiral Mayo, all of whom spent much of their time abroad diring the war, on the other hand many of the member is of the General Board would lik to set the distinction between slow heavily armored battleship and fast, lightly armored battle-enuser in unianced

Why have the English abas loned the battle-crusser type and why are they willing 1 drop a few guns from the hattlishin sewbangs for 1 to k knots more speed and havave armor? The ansex 1 is not far to seek 1 is a found in the Battle of Juli and where there of the British battle-crussers were sank by gunfire and where a few knots noure speed would by a cambre the British battle-ships to plant themselve squarely across the line of retreat of the German Rev! 1 is own ports

Now that the threat of aggression has been removed from the high seas and the call for haste in award construction is no longer heard there is every reason why we should proved with great caution in the determination of new designs for our Nax. The history of navid construction among all nations is largely a history of preparate action leading to the construction of types of ships that were assortanted t be of doubtful value each before they left, the st ks and therefore we count it a matter of good fortune that honest and helpful critisains served to prevent the construction of our battle cruisers as they were originally designed and will result in groung as a new type which embodies in stelf the combined strategoral and tactical lessons of the recent ware.

# The Scientific Insurgent

HEN acopted acentific doctrine is allowed to tain the statuted of them does not obtain a vase in point in the attitude of the modera would through the creturins when bleeding was the one rundy for all ills, and it was forbidden even to sugars that a sufferer from fever he allowed to drink. Current doctrine is accepted because it must be true be raine if it is expected, and anyone who attempts to burst the bonds of this vieiness critical was a sufference of the superior who attempts to burst the bonds of this vieiness critical was a superior and anyone who attempts to burst the bonds of this vieiness critical was a superior and anyone who attempts to burst the bonds of this vieiness critical was a superior and the superior was a superior and the superior was a s

One draw hank to such involuted orthodox; as that the theume and doctures white I don't a orthodox; supports are not necessarily true, and by the categorical refusal to discuss them, insulated orthodox delaws their replace ment by a better creed "si long as it was forbiden to question the Ptolemaic system so long was recognition of the Copermian system impossible So long as physicians were horrified it the mere idea of omitting to bleed and held that one who, ark a fiver patient a drink was convicted of malpractice in the mere, showing of fact so long was progress in node into inhubits

But the fact that orthod xx s refusal to debate its behafs leads to persistence in error is not the only indictment against it Every scientist must have his behels with reference to the fundamentals of his science, but when he refuses to debate these beliefs to listen to arms ment of any sort, to admit that there is anything to be considered save the weight of authority, or that the questioner can be anything other than the rankest heretic this is not a healthy state of mind Modern enlightenment calls down shamt upon the head of hun who cannot afford to most objectors on their own ground If accepted doctrine cannot point to facts which contradict an alternative hypothesis or which fail to be explained by that hypothesis or which are poorly explained thereby—then accepted di trine, if it be promulgated in the modern scientific spirit will admit the alternative hypothesis to tentative standing and institute a vigorous search for new facts which substantiate or disprove one of the conflicting theores. And when accepted doctrine fails or fears to do this it admits weakness

Accordingly we have no avmpathy for the point of wire which condensus a new system, almost before it has been advanced, enths ground that it is new Of course there are limitations there as everywhere else we will not debate seriously with the man who maints that the suit is cold because as he climbs a monutarn and gets nearer to it, the temperature falls, we have been known to reason with individual entesquisars, but with the iribs we have little patience, and in general, with the advocate of a new idea who willfully blinds himself to the merits of the old we have as little patience as with the advocate of the new days who will not seen to look at the new But when a new hypothesis of any nature is advanced in a rational manner, with due recognition of what it must do to replace the old, and wide as intelligent and especially with an interesting attempt to do this, then whold that it alians attention A certain amount of mild heterodory is far preferable to unreasoned orthodory, and it is beneath the dignity of no one to read and rumnate upon the ideas advanced by the scientific insurgent.

An interesting case in point will be found in the current number of the Scientific American Supplement. A New Zealand amateur scientist of some note has built up with pains the suggestion that, after all, perhaps it is not fair to treat the moon as a satellite of the earth, which goes around the sun only because the earth about which its orbit lies goes itself around the sun He brings forward the supposition that the earth and the moon are rather to be regarded as twin planets, each with its individual orbit around the son, and each with the perturbations in that orbit raused by the presence of the other He unfolds this believentric theory at considerable length, in a most interesting manner, and with enough plausibility to keep constantly on the siert any reader who may bring to it the viewpoint that he will not admit it under any consideration. On every groun no one who is unwilling to admit prejudice need feel that he cannot afford to read this discussion

# British and German Warships Compared

ATH amazing but commendable fraultness with a first plane he made known the fact that though the German fiest at the Battle of that though the German fiest at the Battle of Juliand was inferier in numbers, it was appeare in quality. No other conclusion is possible. Apparently, it was only in ganpower and numbers that the British had the advantage, and even that was offset by the fact that the German belts carried a delay-action fuse, which caused them to burst insade the ship. The British fuses were too sensitive—the bursts occurring on the armor or while passing through it. In view of the fact that we perfected an amort-piezenic delay-action shell over 18 years ago, the revealation by Julifoos will be received with amazement.

Of equal, if not, greater moment is the announcement that the Gorman ships were greatly superior in resistance to the torpedo. This was due to their greater beam, which permitted the construction of wider anti-torpedo spaces between the skin of the ship and the interior, srmored, longitudinal bulkheads The blame for this lies at the deor of the British people, who would not vote the appropriations for building the larger drydocks necessary to accommodate the wider ships Battleships were popular drydocks were not This underwater protection saved many a German ship at Jutland and elsewhere The 'Goeben' was found to have been torpedoed five times, but her maer bulkheads he the ship was still good for 15 knots. The later British ships designed during the war, carry the "blister' or bulge - which serves the purpose admirably, as the monitors proved on many occasions

A greater area of the German ships was armored than of the British, and the average thickness of this armor was greater Moreover, the deck protection was not only heavers, but it extended throughout the altip, the British being content to armor only the magazines and other vista. Thus we bearn that nine of the saclicit British dreachoughts, including several of the battle-cruster, were without protection shore the main deck, whereas all German shaps were protected to the upper

In weighing the critecism we must bear in mind that Cilicoo has been severely critical off ront olosing in to finish the German fleet. His statement therefore is a defense of his poincy it "passers the buck" to the Naval Constructor, who, doubtless, will be heard in he own defense Until that is forthcoming it would be well to reserve judgment. Nor must we forget that the well to reserve judgment. Nor must we forget that the German Naval critic, Capatian Fersitus, recently system the Posskiet "Had the weather been clear, the destruction of the whole German Naval would have remitted."

Was Jallione over autous? That will ever remain a matter of opinion? The samely had some eighty destroyers to his forty. A night attack might have sont him enc-half his flost, and with the British command of the soa lott, the whole Allied cause would have gone by the board. The British would have been cut off from France, and we could not have seen a man to Europe.

# Engineering

Electrification of Railronds in Jealy.—During the var Iday experienced and a shortage of coal that it had to tree to water power, which is found in profusers in that county. Italy was one of the first countries to use electricity on its railroads and there has been a great cold of solitivity in that direction of late At present, projects are under foot to electrify 1,250 miles of railroad.

Manila Rope Made Brittle by Freesing.—A correspondent in the Repnarary News Record calls attention to the necessity of thewing out ropes before they are used Fall rope and that used in standing nigang do not absorb much mouture. They soon dry out and are comparatively free from dirt, so that no special precautions are required in the case of such ropes, but to 90 per cent of moisture. This does the rope no harm, but on freezing the fibers become brittle and the rope weak. It should, therefore, be thaved out before it is subjected to any heavy strain. Dirt also is apt to reduce the working life of a rope, as the grit cuts into the fibers and frays, them rapidly

Concrete Flume in Hawaii —Oving to the searcity of steel in the Hawaiia Islands during the war, substitutes for steel had to be used as far as possible. One of the sugar plantatons a concrete fune was used to carry water across a gulch. The flume was formed as an inverted siphon, consulting of a rectangular box resting on concrete columns. It is about 5½ feet with and nearly few feet deep and is supported should 35 feet above the bottom of the gulch. A bell-and-egget re-pandon joint connects the horizontal portion of the flume with one of the inclined stacks, the space between being filled with apphalto cement. This joint has operated satefactorily without any signs of leakage for a number of months.

Physhology on a Construction Job.—The supontendent of a construction job, says the Engineering Vess Racord, was annoyed to find that a crew of our-peaters did not attend to their work properly, while dirrike was periodically swinging its load one their bands. The mon invariably stopped work to watch the loads pass by A convae avaning was structhed over the earpenters' benches This was obviously no protection at all against a falling object, nevertheless, it served its purpose, because the carpenters were unable to see the work of the derrick, and although they knew that the loads ware passing over them, they did not stop and standershy to doing if the derrick should let go This device resulted in the saving of 10 per cent of carpenters' lost time

Using the Files Economically.—Quoting from Dechemaracule Exemourahoudel the Proctotal Engineer states that a file when new, if viewed under a strong magnifying glass, will be found to consist of fine points or teeth so far as the outing surface is concerned, and if passed over a pose of hard steel or other hard resistant metal it will be found that the majority of these teeth have splintered off, leaving a wary indifferent set of cutting points. For this reason it is best always to use files first on brass and copper alloys, as this seven the teeth from brassing away while the heat engendered by the working friction somewhat anneals them, and makes them fit to follow on with wrought rom and mid steel, harder steel and cast iron taking the lear place, and after those the fites want re-enting if they be that kenough.

Blancing Strength of Reinforced Concerts Beauting—The Energency Fleet Corporation, faced with the problem of constructing ships of concrete, found it is necessary to make tests of concrete beans in order destrains the proper design of construction for these vessels. As a result of the tests made, it was found that, in the case of deep beanse the standards herefolder scoephed had been too fow and that much larger shoaring streams could be used with supply. The investigation is not complete as yet, but the stabilities or far made will have an impringable theiring input the next concrete in other structures years buildings and tridges. In some case congrete jut, and bear used because of limitations in shearings straight inguesed by the steachers that have provedied as to the present them, but with the standards revised these will be an opportunishly fine a whiter use of

### Science

Whele Fat for Making Margarin and Lard.—The last annual report of the U N Commissioner of I siberies states that in 1914 Denumek used 20,000 barrels of hardened whale fat in the margarin industry. Preparations are under way in Norway for utilizing this material in the same way. The product is said to keep and taste well. Whele fat is even botter suited for making lard in this connection it is stated that experiments are in progress in the United States with fish oils to determine the possibility of making them suitable for use in the human diclary.

Medical Men in the House of Commons.—An interesting monoration in the British Parlament is the formation of a House of Commons Midual Committee, consisting of M P's who hold a medical or surgical degree or are specially interested in medical or scenatific matters. The committee, of whi h Sr Watson Cheyne schairman, is to exchange views on all proposed legislation relating to medical matters or kindred subjects, separally with a raw to avoiding the expression of conflicting medical or scientific views in parliamentary debate. He committee will also servo six connecting his between the House of Commiss and medical and there scientifies bedies Commenting on this innovation, Nature expresses the hope that eventually other branches of science may be directly represented in Parliament

The Hot Blast of Volcanoes -- Writing in the Monthly Weather Review, Mr George N Cole sets forth detailed arguments to prove that the hot blast which swept over the city of St Pierre during the eruption of Mont Pelée, as well as similar blasts in connection with the eruption of Vesuvius that destroyed Pompen and Herculaneum, the couple n of Tasl, Sakurajims etc derived its heat from the sudden compression of the air surrounding the volcano and not from conditions in the volcano itself. In other words it was not, according to this hypothesis, an outpouring of hot crater gases that caused the destruction but the dynamic heating of the sir attending the propagation of the Mr Cole eites a number of interesting explosion wave observations at St Pierre after the Martinique disaster that seem to support this idea.

The International Institute of Agriculture has for many years been carrying out within its province undertakings strikingly analogous to those contemplated for the proposed League of Nations During the continued to be a center for worldwide agricultural information, statustical and otherwise. At a meeting of the permanent committee of the justitute on November d0th last, resolutions were passed expressing ardent wishes for the realisation of the league of Nations, and offering the services of the metitute in connection with the work of supervising food production and distribution. eto, for the world at large The resolutions point out that 'during the war the Alliel nations have confederated their activities in the handling of agricultural distribution, of raw materials transportation, and finance," and that 'it may be that the League of Nations to be formed will provide for the continuation of such federated activities" If so, the League will find in the Institute of Agriculture an agency admirably organised for carrying on this important work

Marine Aigm of the Pacific Coast -The economic importance of seaweed is a subject that has of late attracted unprecedented interest throughout the world The last annual report of the U.S. Bureau of Lisharies states that, through the cooperation of a specialist from the University of California, the Bureau has been making a large collection of the marine alga of the Pacific of the from Gray's Harbor, Wash, to Sitka, Alaska Manv new forms have been discovered and the range of species previously known has been extended. The collection a to be deponted in the U. S National Museum terest in the marine sign," says the report "arises from the intimate relations existing between them and the fishes and shellfishes; from the significance of marine plants as ultimate sources of organic material in the sea and thus as an indirect source of food for fishes, and from the fact that the algae are resources useful in some case for human food and in others as the basic material for potash, nodine, gelatin, and other products useful in the arts and industries." The manne algor are still to be classed among the neglected resources of the United

# Industrial Efficiency

How Denmark Uses Industrial Films—the Danish association Danish Arbeide (Danish I alour) which was founded alout tin years ago and whose motto as Buy Danish manufactures when they at as good and se cheep as imported goods has done a gert work for Danish industry. The association has now taken into Expublicity service the showing of industrial films produced by the recently formed Danish industrial film greatest and the state of the product of the second by the product of the product of the second to be used in the achoele.

The Disabled Soldier Problem - Have you a job for a man who is trained for it' is the question the Pederal Board for Vocational Lducation is now asking the intention of the Government to assist in placing each disabled soldier and sailor, regardless of his handicap in suitable civil employment. The men are not to be dealt with from the viewpoint of giving them special soft jobs , on the contrary, the employers of America are requested to consider their employment as a business proposition An effort will be made to place each man in the occupation in which he is most interested provided it is neither waning nor overcrowded. How this is to be accomplished is discussed in a monograph, What the Employers of America Can Do for the Disabled Soldier and Sailor ' Copies may be obtained from the Federal Bureau of Vocational Education, Washington, D C

Alcohol from Lava and Peat -The present shortage of alcohol, especially for motor boats gives appeal importance to the new method for extracting alcohol from eat and lava Though lava was used for this purpose in the middle of the last century when the potato crop failed, it has muce then been neglected. Peet is found on thousands of hectares and a depth of seven to sight meters (22 96 to 26 25 feet) continues Svenak Handelsisdning From 100 kilos (220 pounds) of dried-peat substance about six liters (1.58 gallons) of 100 per cent alcohol can be obtained. This is about the same yield as potatoes The method of extracting alcohol from peat is about the same as by sulfite. The peat is boiled under pressure with sulfuric acid by which a sugar solution is obtained and some residue products. After the and has been neutralized with lime the augar solution is made into alcohol the peat residue being collected and made into briquettes for fuel. The experiments made with regard to this method of extracting alcohol have been successful and the Swedish Government has agreed to the building of a factory on the basis that the shareholders of the company should have the right to purchase and use the alcohol for their motor boats runks, and private automobiles irrespective of government prohibitions and maximum prices

Sending Trade Literature to Canada.-The attention of American manufacturers is directed to the frequent omission on their part of the prepayment of import duties on catalogs mailed to other countries They should first ascertain the customs regulations of the country to which the trade literature is addressed By ignoring these regulations many costly catalogs are either destroyed or returned to the senders American firms contemplating sending trade magazines to Canada should comply with the strictly enforced regulations governing the delivery within the Dominion of trade literature through the mails in bulk Bonu fide trade catalogs and price lists not designed to advertise the sale of goods by any one person in ( anada may be imported duty free in single copies addressed to merchants in Canada and not exceeding one copy to any one merchant for his own use and not for distribution Large numbers of valuable catalogs multid to Canada by American manufacturers have been returned undelivered owing to the refusal of the addressees to pay duty there-The total vz' ie of all of the separate pieces of matter

con The total ve! not fall of the separate pieces of matter should be first secretained and duty paid customs sips for which purpose are obtainable at the principal ports in the United States. Each piece of matter should have written or stamped on the outside wrapper or savelope the words. Duty paid "Catalogs and advertising matter sent in bulk as ordinary merchandise are also dutable.

# The Miami Conservancy Flood Prevention Plan

# Construction of Large Retarding Basins

By W. A. Drake

I MMTDIATTLY following the disastrous flood that inundated Dayton Ohio and the rest of the Great Miann Valley between March 23d and 28th, 1913, active steps were taken to prevent a recurrence of the disaster stops were taken to prevent a recurrence of the disaster A Thood Prevention Communities whose function was to devise some means of protecting the city of Dayton employed engineers to make a careful investigation of the underlying causes and to present some adequate secans of preventing future similar disasters. The novel plant in the hard to the work of the Chaff Engineer Dattrile is the result of the Work of the Chaff Engineer Arthur E. Morgan and his assistants

After the survey had been some time in progress it beams apparent that winter floor protection projects arread out separately by each subdivision of the flooded district would be inflicin it and unnecessarile expensive for this reason a plan of protection for the entire valley was passed by the State I (goslature and the Mismi Conservancy District was established by law in July 1915, with its office in Dayton the largest city in the flooded territory

The floods in this part of this country are not very large comparatively speaking but they are very sudden. The Same River at Paris, which is sulject to quiti serious floods carries a maximum of 89 tXXX second-feet from a

5 400

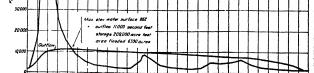

drainage area of 17,000 square inles and the floods last between one and two months. The Miann has less than one-avenath the drainage area but with floods three times as great which, as a rule, are over within two or three days. These overflows rarely average more than 100 second-feet, per square mile. The Dayton Flood caused a loss of 461 known deal and more than 886 785,574 worth of property. The total of deaths was midoubtedly numel greater, the stumate is based upon the number of bodies recovered. The stumate is based upon the number of bodies recovered. A great many projects were considered and rejectful. He problem confronting the engineers was entirely without precedent

March 1913 April 1913 Graph contrasting the flood of 1913 with the rate of outflow from the conservancy basin, had the latter then been in existence Not only did they have to prepare for such floods and storms as were considered the average, but for the worst possible overflows

The engineers analyzed the entire storm history and flood data of the whole country east of 103 longitude District records were insufficient and several of the ex-Datinet records were insufficient and several of the experts spent eight months in Washington abstracting the storin rainfall records. They noted all storins exceeding one inch prequipation in 24 hours, or four inches for the total storin, where the normal annual rainfall was below 20 mokes, and all exceeding 10 per cent of the annual total in one day, or 15 per cent of the annual total in one day, or 15 per cent of the annual total in the whole storin, for the stations whose normal annual rainfall exceed 30 inches. To obtain this data, the engineer divided the United States cast of the 10dd parallel into 133 two-degree quadrangles, divided on the odd degrees. Each of these was a separata storm district. About 1,500 storins wire observed and carefully card indexed. Half of them were found to be one-station astorins, the twostorias wire observed and carefully card moexed of them were found to be one-station storms, the two-to sux-station storms reached 35 per cent of the total while 15 per cent covered more than as stations. The latter received nearly all the study. The time of the storm its area and depth were all noted, and contour

ervancy plan, showing location of retarding basing

maps made and compared The research into rainfalls and floods was monumental and exhaustive All this was necessary The flood of 1913 was not a cataclysm as many believed it to have been it could cataclysm as many believed it to have been it could happen again and at say time. Although it was one of the greatest floods in centuries, certainly the greatest more the what man came, it might happen again on an even greater scale. Though unlikely, it is possible that the valley might be exposed to a storm, 20 to 25 per cent in excess of the 1915 limit. The district is working to provide for maximum floods by arbitrarily increasing upon the maximum estimated by the engineers. The protection of the valley depends wholly upon the system of retarding basins and channel improvements that are being made, so the engineers must so beyond their own or retarroing casins and channel improvements that are being made, so the engineers must go beyond their own judgment in the matter. The Conservancy system provides for from 15 to 20 per cent more overflow than is believed possible, and 40 per cent beyond the mark of March, 1913

The Miami Valley is 120 miles long from northeast to continuest and 50 miles wide. It contains 4,000 square miles at from 40 to 41 latitude and at an elevation from 500 to 1,200 feet above sea level It is one of the most important sections of the whole country from an industrial and military standpoint. In Dayton alone there are about 1,400 factories, meluding some of the iargest in the United States Recording and computing machines, cash registers, airplanes, sewing machines and tractors are only some of its products, it does much work of great wartime importance. The Wilbur Wright and the McCook Aviation Fields are also in Dayton, and the National Military Home When all this is con-sidered, the protection of the Miami Valley becomes a national problem, and it is being well taken care of

(Continued on page \$90) Fossils Found in Eastern Colorado

By Lorena S. Ellia A VISIT to the Colorado Museum of Natural History A INST to the Colorado Miscum of Natural History
In the City Park of Denver, Colo, and a talk with
the director, J. D. Figgins, regarding his recent discoveries in Yuma County of that state, takes one into

the past far as human eye can see, and then when the outmost boundry of real vision is reached the imagination keeps going right on backward into pre-historic times and sees Yuma County, Colorado, as it was when these same fessils formed the framework of living ammals, about a million years ago

Today Yuma County, in the extreme eastern portion of Colorado, is a treeless eastern portion of Colorado, is a treeless expanse of prairie with a soil of silt and sand where dry farming is successfully earned on A milion years ago it was quite different. It was thin, as was all of Colorado, a somi-tropical country with a dense growth of heavy vegetation Back in the Mesozoic era there may have been trees, but in the time of the creatures whose fossils we are considering, the vegetation consisted of a rank, deuse growth of long, succeilent grassus, a growth prolific enough to sustain vast herds of herbivorous animals without any need of

The first intimation that fossil beds existed in this locality came from H D Boyes, a ranchman living at Wray, Colo Last March while prospecting he came upon some bones which he identified as being the log bones of a rhinoceros. These he

Excavating with electric shovel for one of the

mailed to Mr Figgins In April Mr Figgins joined him and together, with pick and shovel they worked with all the sest of the early prospect as for gold. They soon found it to be more than a two man; h so a force of men with teams was set to work at pleaving and excavating As a result of their summers work there are now in the City Park Museum of Denver some acquisitions to the

Mining for fossils in Fastern Colorado

fossil collection of most much value, all of them being of the upper Misseure or lower Photone periods. Of the dog family the most wilely distributed at the the dog finnly the inst withy distributed of the families of Fiss p for it the present time the claimet species were identified one of these being—very large bear-dog of the middle Thosene—this dog approached in sire the largest of living bears, and could crush the stoutest bones with its massive teeth

The most marly complete skelton found was that of the rhancerose and Mr. luggins says they expect to find enough bones to make it emplet having about one-fourth the number now. This unmit was 13 feet long, 712 feet high at the shoulder and weighed 21 iong, 72 seetings at the should raid weight d.2. This The rimocores had a long and varied American Instory and became extinct in the lower bloome. Indiging from the present geographical distribution of animals few manimum could see in more could to North American than do the rhinoceroses yet according to an est if lished authority the family probably originated here and subsequently spread to the Old World. The collection includes the leg bones too bones and a nearly com-

Of the horse family two possibly three species were found. These were small, about the size of the presentday pury Horses were the most abundant sumals of that period, the lower Photone, according to Osborn, swarming in herds over the prairies. The evolutionary changes which have led from the primitive hye-tood changes which have set from the printitive invertors, bors up to the modern horse are many and ser el ought about, as with all animals, by changing elimitic conditions producing corresponding changes in vegetation. Of all the fossels found by these prespectors none are more interesting than those of the earnel, three

species of which were obtained One, the giraffe-eamel spaces of which were obtained. One, the graffic-earnel, was 18 fect in hight. Like the rhinocires the canel seems completely foruga to North America yet, as a matter of fact, we had this family passed through nearly the whole of its divelipment here, and did not emigrate to other continents before the late Miocene or cathe Photons.

emigrate to ottner comment.

Arriy Phocean.

Of the mastodons two species were unearthed. The parts are, however, very imperfect, being hadly broken but a complete lower new end complete tusks were mound, also two or three log bones, some

# This Mine Produces Coal and Sand

AMINING plant that is decidedly unique is located in Ohio Both coal and sand art taken from the one property strata is high grade molding sand and has an average depth of about nme feet is deposited on a bed of shah about five feet in thickness and under this is a seam of excellent coal averaging from 4 to 5 feet Shipments of sand already base been made considerable tonings of coal ilse has been much as the shift strata is uncovered by the removal of the stud, stram shovels will be utilized to strip the shale thereby exposing the scain of coal which will be mined in the open In comparatively f w localities is the coal scam sulliciently near the surface to permit of strupping The sand is mined by steam shovel and is conveyed by inme cars to a stockhouse from which it is loaded into cars by a belt A force of nine men can load conveyor. A force of 100 toos of sand a day

# Reconstruction in Europe -- V

"Labour"- Great Britain's Greatest Peace Problem

By C. H. Claudy, I oreign Correspondent of the Scientific American in London

So may set I so multitudinous in its immlications 1 trip is many different angles Creat Britains
11 trip ish in seath in unpromaing subject for the
(10 m) (few hund) twords. And yet after having
(11 m) thousand words of repers. intersected cal many thousand words of raports interviewed as a generation of the land attempted 1 gain a projective on the Fingleth problem by Loshing at it from on American study on the frontieron of the land 
guards against the aggressions of apital. In the con-rate what British let ir wants is a continuation of the lengits which war has brought it minus the restrictions changes and alterations in existing standards which are

changes and afferstions in existing assumance with a iso the limit of the gitter to milite. In this district what any government wants for its failure is to have it seatshed with its working conditions and its wages so that there will be absence of strikes or lockouts and an internal peace of every man with his neighbor and with the capitalist for whom he works In the correct what the United Kingdom wants for its labor is a reasonable adjustment of the war promises to labor a moderate degree of patience with the inevitable upset due to the reestablishment of peace time conditions and a sufficient degree of education and compliance of mind to permit the government to carry out those reforms which have been himped in with readjustment

under the much overworked name of reconstruction
Thoroughly to appreciate the British problem two
facts must be born in used always. The first is the facts must be born in used always. The first is the extract and the variety and the power of trades unionism in England I agisuil has been since the memory of man runneth not to the countrary a country of classes That it has been in the main a peaceful one does not disprove the fact that there has been a

class war of considerable magnitude going on for a great many years. The handon for a great many years. The land-owner the capitalist the holder of rights and privioges on one suit the laboring man the craftsman the skilled artisan on the other have fought a miched liattle the other have fought a mitched lastile. The result has been a great tabor Party which if not vet in thi position of the tail which wags the dog is nevertheless of such size and power as to a very large element in politics. Hence when the government made labor a promise it was a promise not only to labor as labor but to labor as a voting power

The second great consideration to be borne in mind is that never before in the history of the empire has it been required that labor lay down labor s For perhaps the first time labor considered patriotism and country first and its own welfare and its own private class war second

the hub of the matter is right here the very beginning of the war that the only way to win it was to have no sloppage of work from any cause whatsoever So the government made a bargain with Representatives of 30 great unions held a con er with the government a presentatives in March 1915 and agreed to do certain things provided the government would do icrtain things. I abor agreed government would do return things. Inbor agreed there should be no stoppage of war work from any ause whatever. Differences in opinion as to wages or conditions or liours or anything clsc were to be settled in certain agreed upon ways but without stoppage of That was what the government wanted do manded and got

But the government in its turn agreed to require of all de contractors and sub-contractors that any departure during the war from practices ruling to work shop shippard or other industries prior to the war should be only for the duration of the war No change in practice due to war should prejudice the position of either individual or trades unions after the war or affect the resumption and continuance after the war of any rules or cust mes existing prior to the war

And now that the war is practically over the govern ment finds (I it it cannot keep its promise in its entirety, no matter ! w much it may wish to do so This is not fault of the government nor of any one else the result of conditions. Thousands of workmen have Thousands of older men boys and women have taken then places and hurned their work. For the industry of the country at once to revert to pre-war conditions and instantly to throw di these diluteus out of jobs because, prior to the wir a trades union had ruled that a certain length of the was required before an apprentice could become a cratisman and because the government had promised pre war conditions in ost-war ilays, would preceptate a cational calamity.

It may be stated with little far of contradiction that

It may be stated when mass that in contradictions some such claimity is going to take place. Labor as by no means unintelligent and can set that the government in nonwealth of a didenma. Set it is reasonable to suppose that labor will make a good bargain if it makes suppose that is now will make a good bargain if it makes a new one and this if, so to spank industry im general and the government in particular is let off some of the strict letter of its agreement, it will be at a preceding. The problem is complicated by the process of demonstration and the resultiement, at the same, turn, of all the funal belp the civil war workers and the dilutes of the latter of the strict of the

generally During the transition is nod between the beginning of demobilization and the time when the country has in a measure begun to settle lown to peace conditions employment is apt to din mish crease. At the time when there will be the greatest demand for work there will be the least work to be had Many factories must go through a remaining process scrap old machinery and get new before peace work can be recommoned. There is bound to be a shortage of raw material because all countries will be trying to got them at once and because production of them is loss now than before the war, and because slipping to carry now that below the way, and because suppling to carry them will necessarily be soant intrhermore, there is always heatation to engage in new work especially con-struction work, in the face of high prices. As a final limiting factor there is a certain amount of dislocation of business and often of disappearance of selling organiza-

tion due to the war Naturally where labor is plentiful and employment

WHEN the citizen army demobilizes its members so back to their jobs-to find these filled, and acceptably filled, by women, bays, older men, and men physically unfit for military service. One of the oital problems of reconstruction, the world over, has to do with the readjustment between these two classes. In the present article, the fifth of his series on European reconstruction. Mr Claudy shows what this problem means to Britain, and outlines the direction which its solution must take --- EDITOR

scane, wages are apt to fall. Always a difficulty where labor is converned, falling wage scales in the face of a high and mounting cost of bring is a calamity which labor naturally will resist to the end. Fractes unions will result a reduction where the will not fagit for an increase. With this fastor the government has to recken intelligently, to avoid desaster. The three principal integers in the ability of labor to enforce its demands are of concer the unimeral strength of its unions, the financial resource of associations and unividuals, and the amount of cooperation or amelicans.

individuals, and the amount of cooperation or amalgamation between the various classes of workers and their organisations. As instances of the numerical growth of tion on veech the various classes of workers and their organizations. As instances of the numerical growth of regarding and a single property of the property

his umon have been largely bettered during the war. The umon had no strike benefits to pay and little legal ane union and no strike seasure to pay and little legal expanse. Both money wags and proportional wage have increased during the war, the latter from "speeding up" and working overtime. Simploi nen't has been steady, every one has had work, and many households, formerly supported by one worket, have had then en units personnel.

down to the children, beco me wage earners. On the down to the children, become wage searcers. On to tother hand, there has been little opportunity for organs of spending. Food has been buyable only was occuped of spending. Food has been buyable only was a composed by the been rapidly held within bounds and could be had only at certain much arreumserfibed times Luntures were frowned upon, partly from patrodiem, partly because there were few luxury factorss at swopen partly because there were few luxury factorss at swopen awang, so that perhaps never before have the poorties who stayed at home and worked been in a better condition financially to engage in any renewal of the class war of labor against capital

war of labor against capital. If this seems a somewhat gloomy picture the canvas is not without its brighter colors. Of course, perhaps none deserves greater attention or will have a more far reaching effect in the solution of the problem, than the educative effect of the war and war labors both upon those who have fought and upon those who have labored at home

Labor has learned of its government from the inside Landor fine learness of the government from the instact Government is no longer a strange extraneous force which must be combatted. The agin th' govern-ment attitude of many laborers who never saw an Irushman, is no longer a commonplace. Administration of rationing systems, which affected high and low alike, the allowance for the disabled soldiers, health provisions for munitions workers, the strict limitations of profiteering capital—all these have done their parts in the education of the average worker to consider his government as something which belongs to him, not semething ment as sometaing which delengs to him, not semething which is a thing apart. And it must not be forgotten that if labor gave up strikes and accepted compilisory arbitration during the war, it received at the same time a measure of recognition from both government and individual industry for which, in many cases, it has striven individual industry for which, in many cases, it has striven vainly for many years

It is endeavored here merely to outline the main avored here merely to outline the main elements of the problem, to show only the question in its broadest and most eatholic aspect. The expert labor statistician may well quarrel with any discussion of the problem which leaves out of consideration those factors, such as the relation of the skilled to the unakilled, the growing feeling of labors, nowfelions and strength disc of labor s confidence and strength due to the heavily restrictive measures which have kept capital from its favorite course of charging all the traffic would stand, and the political aspects of the subject. But it seems as if the question at issue is too clear-cut either to need elucidation by such added discussion or to be benefitted

by the inclusion of a wealth of details.

In the largest sense, the labor question is one of available work to be done and available hands to do it, of

In the largest sense, the labor question afform of available works of the property of the prop

# How Will the Gasoline Engine Develop?

Some of the Things That Intelligent Imagination Sees in the Future

By Howard Warren

WHEN the war broke out the gasoline engine was making steady, if not particularly rapid, progress For several years attention had been directed to the For several years attention had been directed to the improvement of details and the solution of minor problems, the general design remaining unchanged. The period of rapid progress that followed the realiza-tion, a quarter-century ago, of the possibilities of internal combination, help passed, as an accepted power unit, the gasoline engines had sequired, with its acceptance, more or less of an accepted form it avolution toward what-evers it is ultimately to be was taking its normal, deliberate course—one which ordinarily is satisfactory enough

ever it is ultimately to be was taking its normal, delication course—one which ordinarily is satisfactory enough. The war, however, brought new conditions and new demands. It brought the demand that the gasoline engine be made a much better machine without waiting for the lapse of sufficient time for the ordinary evolufor the lapse of sufficient time for the ordinary evolu-tionary reactions. The immediate effect was quicken-ing of effort, with the determination to bring the future back to the present—to do today things that under less streamons conditions would have been left for next year, or even for five or ten years heard pass are sufficiently present of warrains necessity has resulted in the socomplakment of much, and has started hims of sifert

accompliamment of much, and has started lines of affort that are more or less certain to lead to remarkable endings Just what has been done, just what has been started and not yet finished, we shall not know until silence has become an altogether unnecessary precau-tion. But if fragmentary hint are not entirely mislead-ing, there will be ravelations that will open many an eye Some of the results are known, others are not, a great

deal is left to the imagination Leaving a matter of this sort to the imagination is nothing more or less than an invitation to speculate against the future What latent possibilities are there in the internal combustion engine? What undesirable qualities does it possess that may perhaps be eliminated?
Today the most conservative of engineers heataces
before using the word 'impossible,' even though possibility may be utterly obscure. In the past many have used this word who were emment men, as well qualified to express opinions as the contemporaneous tate of the engineering profession Where they erred was in making all their calculations in the light of what they already knew failing to take into consideration the unknown quantity of future knowledge which might-which did-cutilely upset prognostica-

There is, then, ample justification for speculating a inter is, then, ample pushibities of the internal com-bustion engine, without garing too intendy into the undeanably bright light of existing knowledge and being blinded by it. The fact that something is utterly im possible today means only one thing—that we do not yet know how to accomplish it—it by no means indicates that we shall never know how to accomplish it

So let us speculate a little
The thought that turns up automatically is that of
the internal combustion furbine. But while that type
of motor will doubtless come into being, without reon motor will conceive come into being, without re-ciprocating auxiliaries or attuidant drawbacks of other sorts, there is pleaty of room for the imagination to play in, without going beyond the familiar reciprocating engine of today In fact, it is necessary merely to take

ought of some of the commonplaces of engineering for instance when we feed to a gasoline engine 100 eat units in the shape of fuct all we get back in the form of power as the equivalent of about twenty five Using easy, round numbers if appears that something like 10 per cent of the fuel burned is used to generate the power to oversome the friction of the oving parts, that 30 per cent is literally and intentionmoving parts, that on per term a natural and movement ally thrown to the winds—abstract I from the cylinder walls by the water jacket, carried to the radiator, and dissipated in the rush of cooling mr that 35 per cent goes straight out through the exhaust pipe bo it is goes straight out through the exhaust pipe So it is necessary to buy and carry around and handle and pro-

vide space for three gallons of fuel for every gallon that does useful work Right there is a vast field of possi-bilities—a field 300 per cent greater than that of actual-

gasoine engine were as producial of heat as is the gasoine engine, it would be a hopelessly inefficient piece of apparatus. Once steam reaches the evhinders, however, it is handled with the most purely however. If the steam engine were as produgal of heat as is the so that not a heat unit shall be lost that it is possible What heat is left after the first piston has been moved in transferred to another cylinder and set to work on another piston, even unto the third and fourth ex-pansion. When the steam is too old and feels to push pistons it is suddenly condensed and made to do work on the other side of the pistons by leaving a vacuum Finally the heat still left in the water is saved by going back into the builer with the feed water

Compare this with the beautifully simple process of the gasoline ingine. At the end of the stroke a valve opens and 35 per cent of the power that has been created is shot into the air through the exhaust pipe, while 30 per cent is blown away by another route—neither exit being big enough to pass all the heat that must be wasted

These things are done because we do not know any way to avoid them Thinination of the cooling system would allow most of the heat carried off by the cooling water to remain in the cylinders but with existing engines the result would be merely a small increase of power for a few revolutions, followed by stoppage power for a new revolutions, followed by stoppage through overheating. Increasing the temperature of the cylinder walls beyond a certain point first distroys the lubricating qualities of the oil and without oil we do not at present know how to make an engine run Even if we had an cul that would stand all the heat we could generate, however, we could not advance much further, for we should have excessive expansion to contend with. while the metals we use for cylinders and pistons would

# "Second Sight" or Looking Glass?

To the Editor of the Scientific Australia
In a small book ontitled "Psychical Research," one
of the series insued as the "Home University Library of
Modern Knowledge, occurs this paragraph, describing
the result of an experiment with reference to mental transference

transference
"Object a pair of sensors partly open, points downward Percipient says, 'It is a pair of sensors standing up, a little open.' Object a key Percipient 'It is bright, it looks like a key.' Told to draw it, the percipient drew it inverted Object outline drawing of a little flag Percipient 'It is a flag.' I old to draw it, bright, it looks like a key. Told to draw it, the per-cipient drew it inverted Object outline drawing of a little flag. Percipient 'It as a flag. Told to draw it, she draw it as it was, upright, but laterally inverted. The frequent lateral unversion of objects by other per-cipients I have also noticed A different drawing was next made, but put saide and purposely the drawing of the flag again put up. Percupient 'I stall see the flag. Object an oval locket, hung up. Percipient 'I see comething poid, comething hazing, like a gold locket Acted what shape, 'It is oval'.
Now in were of the fact that some of the minute

Now in view of the fact that some of the minute reflectors used by eard manipulators and conjurers give an inverted or reversed image, should not all cases where the "percipient," using that name at its face value, draws the object reversed in any direction, be ruled out as frauds A R WARD.

Sydney, N S. W.

# The Science of Raglish Spelling

To the Editor of the SCIENTIFIC AMERICAN In a letter in the SCIENTIFIC AMERICAN of Dec 21st in a sector in the occurrence American of a Universal alphabet. To make one would be a big program A much angalier program would be the sensitific representa-tion on paper of the sounds used in standard English speech. Usage has in the course of centuries done most part of the work. Bue had only 20 letters of the alphabet

to work with and she had far more sounds to represent to work with and she had far more sounds to represent, so she invented digraphs and trigraphs and tetragraphs, and with them she had far and away more means of representing sounds than she had sounds to represent a represent the representation of the representatio Perhaps you may lead us wrong and make things

worse than ever people seem to sty.

No doubt some digraphs that Usage has introduced are as well established as the most fundamental letters of the alphabet We have for example the digraph ch which might be called chay, and the digraph ag, which might be called ing, and the digraph as which might be called sh, and the digraph th which has to represent two sounds and might have two names ith and these

two sounds and might have two names the and thee All these digraphs are perf and parcel of our system of representing on paper the sunds of our speech. The letters a, e, i, o and it lying has appropriated to the representation of the sounds cilled short a, short o, short is short o and short u as in the words pat, pet, pit, pot and but

pot and but

Then Usage had the sounds I ng a, long c, long t,
long c and long u to provide for and she sometimes
represented them by the letters a c 1 c and u, gs was
only natural as the letters have the names of the seume
Usage also tried those letters f slowed by a consona t Usage also tried those letters i month of the mito, mote and then by an e as in the words mate mete, mito, mote war entisfactory. Usage and mute But that was not very satisfactory Usa graphs. And there is a merino distance are obtained graphs and there is a require lattic raging whether the digraph is should represent the sound heard in the English mans of the letter e. And there is another furrous bath for the honor of representing the sound heard in the I ngish aams of the letter

senting the sound neard in the 1 nglish name of the letter I And there are minor sugagements, too I have written a pamphit alout the matter called "The Science of English Spriling and I would send a copy of it post free to any of your readers who would do e the honor to write for it

WM CUTHEREST HOLMES.

# Bamboo Pipe Organs

To the Editor of the SCIENTIFIC AMERICAN In the article on page 328 of your usage of Orober 19th last, you say the stated that there is one other bamboo organ in the orient but it is not possible at this time to secure definite information relative to its whereabouts

It may interest you to know that there is a bamboo organ in the parish church at Las Pinas, a minicipality on the bay eight miles south of Manila. It was begun in 1818 under the rectorate of Father Diego and finished in about 1823, damaged by the famous earthquake of 1863, partially repaired, but then neglected until rently It is now playing
It contains 832 bamboo pipes and 121 metal pipes

(bugiers) outside the organ
It contains 23 stops, 12 on the right and 11 on the left

1-Light trumpet 2- Accompaniment trumpet 2—Bugler 3-Major flute 4-Viohn flute 3-Major flute 4-Major violin

5-1st octavo 6-2d octavo 6- 2d ortavo 7-Docena primera y segunda 7-1st docena 8 -Quincena primera y segunda 8-2d docena 9- Grman flute 9-1st quincena

10—German flute (buglery) 11—Piccolo flute 10—2d quincena 11— Nightingale The keyboard, contains five octavos

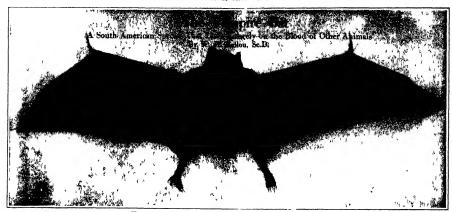

The 19 tone major notes first to the left have similar sounds and the 17 chords to the right have different tones, the tones begin from the seven last major notes

to the left I here are 12 pedals The drum and nightingale sound like those of other organs, but by pouring a little water in the deposit it produces the song of birds and for that reason the

organist on Christmas I ve has always a bottle of water by his side to use when he wants the enchanted birds to sing.
The bamboos have never been painted or variabled according to the oldest man of the locality, but when they are wiped with a wet rag they appear to have been

The original pipes still remain in a state of remarkable preservation but it has been found that the new ones were subject to dony and the attacks of inaccts

THOMAS CARY WELLH

The only photograph of the vampire bat to be found in the United States

I HUT 110 MIIIIR U.S.A. engaged for six A years in making a zoological Survey of South America for the American Museum of Natural History New York has turned in to that institution more than 100 specimens of the vampure but together with other and large collections of new birds mammals and reptiles arge collections of the birds manimals and reprices. These bats will now undergo an intensive study by men of varied branches of since in order to add to our incitedore slender knowledge of the only true vanipure known. The late (c) and Roosevil declared the exist known The late (clinic Roosevelt in delared the exist time of this necturous increase to all animal life on his return from his Brasilian capedition. It raintained for Fourtmant Miller however to risk his life to capture a large (oldection of the indinght assuming for study and exhibition

Luntenant Miller has further distinguished himself

Hamienhali Milite has intriner distinguismen numbers by writing a book on his velorations entitled. In the Wilds of South America from which much of the following state uncateoner imige to supprise a best reached. The trust from C ochabumba gots up stacisly until an elevation of 12 080 feet is reached. Beyond the high summer of the first ridge, lies the high mountain valley.

in which is located the Quechina village of Cuchinnelia, including pig pen—the trail leads castward to an elevation of 13 400 feet—We had traveled to the Surgas on mules owned by the expedition and upon our arrival turned them loose to feed as usual

Next morning the animals were in a sorry plight They had been visited by vampue buts during the night and bled as badly that we had to send them back to I rotal without delay. Severe as this attack scened to be it was mild compared to what we were to see later on

We discovered clumps of small bats gulity of the execu tion spending the days under the rist of our but and despatched many of them but only hit and despatched many of them on this made no impression whatever upon their vast numbers. Humans also are bitten on any pirt of the body which is left exposed at might and I have fre-quently seen Indians who had been a

quently seen Indones who had been thecked on nose forched and arms. The forest of Iodos Sintos was foll of supprises. At night vampure butscame out in bordes they attacked every those from human beings down. Iven the few mescrable pigs lept by the Indians were secretly liften and kept up a con-tinuous spiraling as the I hood thirsty rectures settled on their usually at the retires settled on them usually at the best file ers and began their pumful oper toms. He wast sufferers by fire however wer an mules. As soon as the sme set an ice is brought the snimals to the curd and strapped anyas covers over them a pec aution of little avail for the bats attacked the expect parts causing the mules to kick and roll with the result that then e vers were som tern off

We went out frequently to wat h these oxious credures at work. After or obnoxious credures at work cling above their prospective victor several times they dropped suddenly usually upon the neck or flanks and at once began to bite and suck making a grating sound with teeth all the while. They paid no but clung with fedded wings to their jrey perfectly motionless and in an upright jostion. If we moved

The upper incisor which serves the vampire bat in puncturing the hide of its victims

they uttered a few squeaks but made no attempt to fly until we reached for them not came to within a few inches when they reluctantly flutered up but almost immediately settled on the other side of the animal

In the morning the mules were in a pathotic condition, blood continued to flow from the wounds made by the

Colonel Roosevelt's mule, which was almost destroyed by the vampire bats in Paraguny

bats sharp teeth so that the ground was red and the unimals were covered with blood from head to foot It was always necessary to take them to the river and wash than then disinfect the numerous punctures II this is not done flux attack the sore spots, infesting them with their larvax and the animals die of blood poison. After three nights we were compelled to take the mules back to (ochabamba, as they were on the verge of exhaustion

Of all the world's creatures met by Colonel Roosevelt in his explorations for the Smithsonian Institution and in his explorations for the Simithsonian Institution and the American Museum he found the vampire but the super-monster of iniquity compared with which, Armageddon and mislefactors of great wealth were as nothing. In his work. I brough the Brasilian Wilder-

Results, and the land of the bloodsucking bats. We were now in the land of the bloodsucking bats. (Vepotuba River Paraguay.) Those are the vampure bats that suck the blood of living creatures, clinging to or lovering against the shoulder of a hors or cow, or the head or foot of a skeping man and making a wound hand or foot of a skeping man and making a wound from which the blood continues to flow long after the but a thrist has been stated. At lapirapoon there were mithe cattle. One of the calves turned up one morn-ing weak from the lows of blood which was still trackling from the wound forward of the shoulder made by the bat In places not only muke and cattle but chukens have to be housed behind batproof protection at night

nave to be housed lichted battproof protection at might. In offender as rol various species. One of the Brarlian members of our party Hochait, the botance was a colloged able. Ho informed me that he had known even the bug fruit-esting base to take to blood asking. I how off not, as corting to has observations asking. I how off not, as corting to home of the same of the original would be the same of the sa

the true vampires they would lap the flowing blood and enlarge the wound South America inskes up for its lack, relatively to Africa and India, of large man-eating carnivores by the extraordinary ferocity or bloodthirstiness of vampire bats of which the kinfolks elsewhere are harmhas it is only here that fish no bigger than a trout kill swimmers, and bats the size of the ordinary 'flittermice' of the northern hemisphere, drain the life blood

of big beasts and man himself.

The vampire bat exclusive to South America, is known to science as Desmodus rulus. To meet all the requirements of a true vampire, it is perhaps the most highly specialized animal in existence, not excepting man himself. As a good guess, the vampire bat may be said to belong to the exclusive faunae of South America, arising successively from ancestors, the remains of which have neither been found remains of which mave heather took toward in fossil form nor in existing forms yet discovered. Their relationship to other bats of the world, of which there are at least 2,000 species, hangs on several minor

characters These or similar structural characters are found in the family of bias known as the Phyllostowides, a North American tribe of fruit asters having small leaf noses Miller says "They are like the Phyllostomidae in respect to wing, pestoral girdle, and pelvis, except that arm) are more nearly equal in saic The fluids (lower leg bone) is large, extending to the head of the thing faith bone). All of the long bones of the leg and wing are deeply groved for accommodation of the muscles. The teeth are highly specialised for cutting, all trace of the crusting surface reduced that the length of the entire upper row is less than that of the cannot teeth. The stomach is a slender structure. The nostrils are surrounded by dermal outgrowth that form a very rudamentary nose leaf".

I examined the South American specimens in the American Musuum, both skeletons and skins. The blood surking characteristic comprised two large, projecting upper incisor teeth, which worked perfectly with two lesser lower incisors perfectly with two lesser lower incisors of the state of the state of the state of the state of the lesser in the state of the

tension, furnished at its extremity with a number of papillae (nipples), forming an organ of suction

papillas (apples), forming an organ of sutton. Most penular, jouwers is the fact that in it process. Most penular, jouwers is the fact that in the process of an order to become a true vampire, the creature has consolidated all of its intestines into one tube or alimentary canal. It has no other intestinal organ whist ever, and in consequence nothing but a liquid can pass through it. Just what must we conclude from that? Some of the lowest forms of animal life having only an intestinal tube, digest food as fast as it enters than intestinal tube, digest food as fast as it enters than gorgue, itself with the blood of another animal having nor searour in which to store it is suncheave but it simultaneously and rapidly assumilate the essential constituents enterly through its own wasten Or on the other hand its intestiniorm tube may be food to the control of the sunch that the vamping which is the considerable amount of pilfered blood retiring to its retreat to hang up by ta feet during davlight digasting at lesure. There is also the possibility of consolidation in the term to the term of the considerable amount of pilfered blood retiring to its retreat to hang up by ta feet during davlight digasting at lesure. There is also the possibility of consolidation in the term of the considerable amount of pilfered blood retiring not as the retreatment of the form that is maintained for the more of the transition of the term of the ter

The bat is unquestionably not only the oldest but the first mamma! It seems to have arrived river from some unknown type of reptile that aspired to safe avaitour rather than crawling walking or running While it bears much resemblance to some of the prehistoric flying reptiles, the structure of its brain case shows little or no affinitive in that direction An everall parallel is a Confession of the December of the Confession of the Confession of the December of the Confession

All Hillsin fields are of 2 lines even those adjacent to 1 with and with where they are in a single line.

return home, by the rapid spread of a fire in one ship, the night after she had cleared herself of mines. The sleeping officers had to escape in their night clothes, and the men in the engine room were barely able to attend the pumps without sufficiation

There was the further chance of a surface raid destroyer escort was prepared to engage its own kind, as well as submarines and even to make a sacrifice attack

on light crusers, to assist our escape, but our moderate speed—15 knots at best when keeping together—and the small number and caliber of our guns, made us number and cantor of our guns, made us rather helpiless against an enemy cruser's long range six inch gunfire and 28 knots speed Moreover, when the enemy began to feel the barrier's restriction on his submarines operations, it was expected that he would attempt to sweep through and destroy us who were blocking his way The heavy ships in support were intended to prevent that, or else to bring on a fleet engagement. In these ways our sensitive squadron would serve a double purpose. either one of which would help end the war but possibly also ourselves

However all that did not worry Stick to your job and go up with it," was the prevailing spirit. The work was was the prevaining spirit. The work was too interesting, steady and arduous for uneasy thoughts. The 'San Francisco' and Baltimore, old hands at mining, set a high standard and fast pace, which every man was keen for his ship to equal and it was well understood by all hands that only the best efforts of every soul could make the kind of team work-throughout

each ship and by all ships together-needed to produce the success promised in

To maintain a careful habit among the men, without making them jumpy or fearful, the absolute necessity for sustained attention was emphasized the same care being needed with the 800th mine as with the first or the fifty-first And to prevent

over-confidence growing with familiarity, unremuting pains wer, exercised to note and follow up all irregularities and apparent slackness—not to find fault, but keep things taut overwhere and carry each excursion through with better than railroad precision

The start of mine planting was always preceded by a busy half-hour Accurate determination of the position of the field—necessary to know in running the next

excursion close by, and also for sweeping up after the war-depended on steady war—depended on steady speed and steering, with a minimum of changing courses after leaving the nearest fixed mark. There could be o heatation nor trial moves The squadron would approach, take a preliminary formation, turn ships together into a line abreast, stret into a line abress; stretching sometimes a mile and three-quarters. Then after a brief steadying interval, down would go the planting mgsal, and overboard the first mane from each ship.

Since all 10 ships abresst would widen the field unnecessarily, the mining would have been with only sinks about

begin with only eight abreast two m another line 500 yards ahead When places directly

astern of them were vacated, these two would case back into the main line, their predeceasors speeding ahead Amnie time was allowed to do this slowly, before their turn came to plant, so as to avoid any extra demand on the engines, which might follow, if a ship dropped back too fast. The steadiest too fast. The steadiest the rule throughout the mine planting, to minimise possible causes of casualty The decrepit, but we took no pesary chances of spoiling a good performance by the squadron as a whole

When all mines were out of one ship, her line was prolonged by a parallel begun at the same instant by her prescribed successor Mines were dropped every feet, in lines 53) yards apart, the nearest distance the minelayers could safely steam abreast The schedule arranged to narrow the minefield towards the finish both for compactness and for a greater

both for compactness and for a grossor margin of safety in running the next ex-cursion parallel and close to, when there might be a beam wind or unusual current, tting towards the former field **Faken** altogether, minelaying is not too simple an

years ago, and this allowed of making oper ations on the lower limbs and the lower part of the body without pain by injections of cocnine or similar substance into the spinal column But this treatment did not due msensibility in the upper part of the Within a recent period Dr Le I illatre succeeded in making the entire body insensible by the use of a single injection and the liquid comes in contact with the spinal column throughout its whole extent column throughout its whole extent. He makes use of an injection needle and a glass syringe. After purjation the day before and also half an hour before the operation he makes the injection of the liquid which is cocame or other substances such as sulfate of strychnine and sparteme. The patient has his eyes bound so as not to be affected by external movement and he sats on a table with his leas stretched out before him. The application is made at the lower end of the spinal column and upon making a puncture the liquid surrounding the spinal column flows out. When a sufficient amount has flowed depending on the degree of insensibility which it is desir to produce, he applies the syringe with the cocaine or other solution and pushes in the contents. This action is repeated several times and the operator obtains a properly regulated mixture of cocuine and the spinal fluid. The insensibility of the lower part of the hody is almost instan-taneous, in the trunk and in the arms and head it follows a few moments after the patient is in a condition to undergo almost any kind of surgical operation and without pain but he remains conscious

It is not that with the properties of the will with the properties of the will with the properties of the will with the properties of the status of the properties of the will with the properties of the properties of the will be propertied to the properties of the propert

antiquited machines inti-quited in the military sense which means a type that has been in use if the first for some mently and that has fallen into the hards of nas than in the arms of the enemy with its w dith of an vations and sorts and the article of the integral and the art interesting of phit graphs have then told but a small part of the entire but a small part of the entire stiry In after all is said and done there is nothing like viewing the bestibed hke viewing the he articles at 1 st hand

To chind it an American Dellavilland buttleplane to ain the twn machini guite aboard a hombing plane to to, with the so-called camera gui used in training serial markemen to study a at close range to peer into the cockpit of a British B E-5 Scout to stand B L-5 Shout to stand beneath the wings of the gunt Handly Page to see at a glance the leading airplanes of the w '!—all these things and many more were the privilege of the visitor to the New York Aeronautical March 1st to 15th in the Madison Square Carden and the 69th Regiment Armory The visitor had an oppor tunity of seeing for himself what others had seen and photographed and described for him during the past few years And he had the op-portunity of seeing what had never been described par-ticularly in the way of planes for civilian use

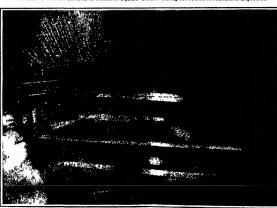

In the matter of military planes it appears from the massed exhibits that the designs have become more or less standardized as the sult of years of competitive effort although during the Alked and particularly the American designers were beginning to question the effi-ciency of accept d construc-tions and were delving into strange fields Most of the tions and were delving into strange fields. Most of the scout machines single scators intended for combat work—either fellowed the general lines of the I reach Spad or the fish shaped planes of the Germans When it came to engines machine-gun equipment, fittings and other details, however there

seems to have been a wide divergence of ideas But all scout plane designers agreed on the cutting down of "parantee," which means unnecessary guy wires, landing gear parts, engine housings and other surfaces offering considerabe head resistance and religiously offering considerable head resistance and religiously applied the stream-lanng which I douard Nicuport first introduced in the monoplane bearing his name. In two-scater battleplanes and general utility planes, the divergence in designs is pronounced. Yet the

general design and equipment of a viteran DeHavilland-lour American plane, which was calcited to thousands of curous visitors may be taken as a good example of that class of lighting machine. With two synchronized mounting the forward and twin ma him gives on a seast mounting account of likel in the ris-vay days of the war. As for large planes, the leading Wit of and timenen types acre well represented. An Witness-built Hand-

General view of the exhibits in Madison Square Garden during the recent Aeronautical Exposition

General view of the well-arranged exhibits in the 69th Regiment Armory

ley-Page and a Caproni triplane and the all-American Glean Martin bomber, were on hand In fact, like nothing else these planes, which by the way are by no means the largest in the world "street to convince the layman of the immediate commercial possibilities of the airplane

Ferhaps the most interesting exhibit of the entire Exposition from a connoisseur's point of view, was the Loening monoplane, developed by an American engineer

during the cloung days of the war and a little too late to serve at the front. The Loening monoplane is output with a Hupano-Eusse engine of 300-horse-sever rating. Its monoplane wings are approved by four nursely spars running at a slant from the underneath side of the wings to the fuselage. Two seats are provided, on for the observer. Complete, and loaded the monoplane weighs 2,600 pounds it has a speed of 145 miles an hour and a "ceiling" of 25 000 feet, carrying sufficient.

fuel for three hours De-spite its rather unorthodox design, this very remarkable machine has established enmachine has established en-viable records among mili-tary planes, and had it not been for the signing of the armistice, the Loening monoplane would have established still more startling records

If anything the Christmas Bullet of hiplane design is still farther removed from accepted practice. This from accepted practice. This machine equipped with a Hall-cent 210 horse-power engine is a single-seater, weight 2,100 pounds with its load and has flexible wings. Its upper plane is 28 feet wide, while the lower one is about one-half of that There is a complete absence of struts between planes, there being a combination wood and steel cantilever structure running throughout the planes to give the necessary support By casting aside all usual means of aside all usual means of bracing the wings, the de-signer has certainly gained tremendous speed with a comparatively small horse-power, but it remains to be seen whether this does be seen whether this does not entail too great a secrifice

of structural strength
The Gallaudet D-4 homber is a seaplane of interesting design because while it has but one engine and a long fuselage member, it employs a propeller instead of tractor a propeller instead of tractor or pulling' ar screw This is accomplished by having the Liberty engine drive the pushing' propeller attached to a ring surrounding the fussings, at the rear of the occupants. In official tests occupants in official tests the Gallaudets essplane has proved quite remarkable with a high speed of 126 miles an hour a slow speed of 426 miles an hour a slowest getaway of 46 miles an hour and a two-mnute climb of 2,100 feet. All of which goes to prove that of Gallaudet design is quite correct

gard to the matter of speed There are several claimants to the title of "the fastest machine in the world" One

machine in the world "One charmers of these is the Christmas "Bullet" which claims a speed of over 180 miles an hour Another is the Thomas Morse MB-3 biplans, equipped with a 300-horse-power lispano-fluss engine, which waghs 2,000 pounds loaded with its angle passenger and claims 165 miles an hour Still another is the Curtiss 18-5 biplans, equipped with the Curtiss engine and weighing 2,800 pounds fully loaded, and for which 183 miles an hour is claimed With the exception of the Curtiss, which Continued mass 190:

# The Wireless Compass

Piloting Ships Into Port by Radio

By Jerome Lachenbruch, Radio Electrician, U. S. N. R. F.

A COIL of wire, a dial registering 380 degrees, a hollow stool shaft, and an automobile steering wheel have overcome the terrors of log and storm to manners approaching port. These few jucces of apparatus comprise the essential parts of the radio compass, an instrument whereby the bearing of any ship on a whore station may be assertaimed with speed and accouracy Through the stimulation of necessity, the radio compasor direction finder, as it is sometimes called, has been in constant operation on naval shore stations during the war Its value has been proved by service, but publica-tion of its efficiency has heretofore been prohibited

With the coming of peace, the attitude of absolute secrecy maintained by the Navy Department in regard to the many inventious perfected by this branch of the military establishment, has relaxed, and the scientific means whereby the men of the navy helped to protect our ports may now be disclosed. The radio compass. which has served us in time of war, is now interpreting

the needs of peace
It is not generally known that wireless operators are It is not generally known that wireless operators are on watch every second of the day at various naval shore stations in the vicinity of New York nor that during the war operators timed the length of as well as the interval between dots and dashes whose characteristics ed suspicion, all the while manipulating the wheel of the radio compass to obtain a direction on the sending station. This exhausting work proved to be of valuable sassistance in locating enemy wireless stations that per-sisted in the surreptitious use of radio despite the governments war order restricting the activities of all but government radio stations

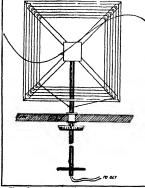

government radio stations.

In construction, the radio compass differs from the usual radio receiving set mainly in the type of antennae used. The familiar aight of several strands of wire stretched at considerable length between high masts is stretched at considerable length between high masts is sheen! In place of the stationary, space-consuming aerial is a rotating five-foot frame with a few turns of stranded opper-brons, wire wound about it. The frame is mounted on a vertical steel shaft which projects downward through the roof of the yado building into the room where the operator is on watch. In many stations, a cupola has been built about the frame with the double purpose of affording protection against the elements and of concealing its presence. At the base of the shaft and within easy reach of the operator, the wheel which controls the turning of the frame is attached The compass dial, usually a curcular aluminum hand with the 360 degroes of the compass clearly engraved on its surface, is fastoned to the shaft near the roof of the radio shack but the indicator is placed in a permanent north and south direction Two leads from the frame form the elec-trical path between the antennae and the receiving set

In conjunction with the receiver, an oscillating audion and an ampli-fier are usually employed thereby magnifying the strength of incoming signals about eight times their normal degree of

audibility
The theory on which The theory on which this unique construction of the radio compass operates involves several characteristics of the electro-magnetic wave it as pure sine wave (which is never met with in practice because of the distorting indistorting influence of objects in and around the radio room), is assumed, three phe-nomena of electricity combine to give the re-eults observed in the radio compass. They radio compass They are the resisting or "bucking" action of in-duced currents, and the differences in amplitude and in phase of an electro-magnetic wave at different intervals of In the accompanying diagram,

plane of the radio compass is shown parallel to the on-coming wave which strikes both sides of the wired frame at different phases and at different amplitudes. Two cleature currents are induced in the antenna the one when the magnetic wave comes in contact with the nearer side of the arial the other when it reaches the farther side These induced currents will be in the same direction and consequently will tend to buck or direction and consequently will tend to buck or counteract each other. But due to the differences in

The radio compass turned parallel to an oncoming

amplitude and in phase of the magnetic wave at the two amplitude and in phase of the magnite wave at the two points of contact, the induced curr at swill be of different attengths and although the one tends to oblitrate the other the difference in strength in twent them is conserved and heard in the telephonis. However, and an incoming electro-magnetic wave strikes the plant of the antenna perpendicularly the currents induced in both sides of the compass will be equal in strength of the same phase and amplitude and will neutralize

each other. No sound is then heard in the telephones. By means of the rotating antennae, the angle at which an electro-magnetic wave acts on it can be controlled by the operator Thus the intensity of an oncoming signal can be increased diminished or completely tuned out by plane of the wheel It is evident then that when the oncoming wave, the sound heard in the phones will represent the maximum strength of the oncoming wave By turning the antennac until this point is found the maximum strength of any signal can be avertained and consequently, the position of the ship or shore station sending it will be disclosed. But to be more accurate, two positions are made known 180 degrees apart. By ulting the diagram the reason for this is appear at will be observed that two waves coming from opposite di rections will affect the radio compass in the same manner

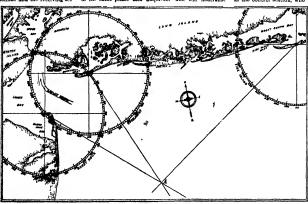

In actual practice however a shore station operator knows that the coast line limits the are of the compass in which he may expect to locate a ship. Moreover to secure the best possible results in the cycry-day operation of the radio compass in guiding vessels into the port of New York, feet radio compass attaining visiting into the part of New York, feet radio compass stations have been estab-lashed at strategic nautical points on the coast near New York. I ach station is connected by a land line telegraph instrument with a central controlling radio station located in the office of the District Communica tion Superintendent, at 44 Whitchall St. This station has been brought to a state of high efficiency by Lieut Commander R B Coffman and Lieut M W Arps

who is in direct charge of the control station.

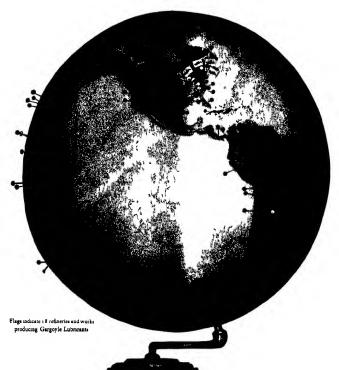

The close connection between the compass stations and the control station simplifies the details of communication with vessels at sea. Within a few minutes a slip may receive definite information as to its position When a ship approaches the 50 or 100-mile coast line, the operator aboard calls New York and asks for his bearing. The ship does not get into direct communicacom with the various company stations as they are equipped only with receiving sets and so cannot reply However, the radio operator at the central controlling station in answering the ship a call transmits a signal to the ship to send its call letters for 30 seconds. At the same time, a telegraph operator at the control station notifies the various compass stations by means of a three-letter signal sent simultaneously to obtain a hearing on the ship sending her call letters. Immediately bearing on the snip senuing ner can letters immediately the various stations in the district, at Montauk Point, L 1, Fire Island, L 1, Rockaway Beach 1 1, Sandy Hook, N J and Mantoloking, N J, turn their compass eels until an accurate bearing is obtained at cach station. This is transmitted to the telegraph operator at the control station, who waits until all stations have

sent their bearings before turning them over to the radio operator The latter when all the compass stations have been heard from, flashes by radio the bearing, in degrees, of the ship on the different shore stations An acknowledgment from the ship of the receipt of the desired mformation completes the opt ration

The accuracy of the bearing reported by each compass station is destation by consulting a map of the coast which is arranged with an inis arranged with an in-genious device for the particular purpose it serves. The map spread out on a large table is covered with glass. Holes are punctured through the glass at the center of the large circles drawn about the various compass stations as cen-ters. The circumferences of the circles are divided into degrees Threads (Continued on page 308)

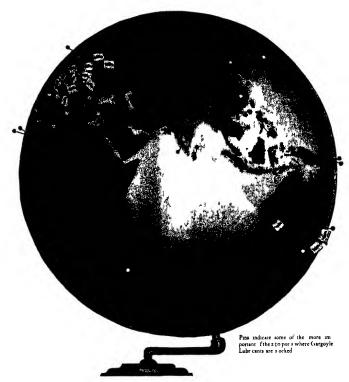

Approaches to New York Harbor showing location of three radio compass stations and how position of a ship sending signals from A may be determined

A new science writes its mark across the faces of two hemispheres. The last 50 years have been called the Mechanical Age. The 50 years ahead will bring the age of Mechanical Efficiency.

In 1913 an international conference of Vacuum Oil Company executives

and engineers from 14 countries finalized the lubrication ideal—the right oil in the right place in the right way.

Lubrication as developed by the Vacuum Oil Company became a science which has opened the way to a new mechanical efficiency for the age ahead.

The work must go on.

Countersinking screw head Instead of using a special tool to countersink a seriew hole for a flat head wood seriew an inventor has formed the head with flutes that it will do its own counteranking It will also exert a continuously increasing tightening action as the serew head is driven into the wood

Deglutitory cup -An invention of very different character is one adapted for the sick room. It is an arrangement where by it is possible to swallow inclinies with out exp reneing any disagreeable taste. A small cup is provided which is held in a wire clip that may be attached to the the accompanying illustration. The tunibler is hest partly filled with water and then the cup with the medicine in it is fitted to the tumbler The patient merely drinks the water in the glass and at the same time the medicine flows out and floating on the blm of water is kept from coming into contact with the tongue. Not only liquid medicines but capsules pills and powders can be taken in this way

Hog holder and stock chute Flater has received many inventions pertuning to the farm but as yet as manife tures has edied for suggestions that helping in this class. Here is a device that should appeal to the fermer and stock man. It is a chute for loading h ga mt wag ma for market and also a holder for full grown hogs at ringing The d vice is in the form of crate int which the hog is driven. At one end there is a gife with a wide notch in the bottom which closes down over the neck of the how as shown clearly in lar 2. In this position the gate is locked and the ringing operation may be performed with case Fig 3 shows the crate tilted up on a pair of folding legs so that the stock can be driven into a wagon or truck of standard height A section of the floor 11. I ditor to anxious to help manufacturer

It is ditto a cursion to help manufactures. In he have allowments on this has desiring this reconstruction person it is he are looking for new at the stickly for them is manufactures. # Suggestions for Invention

TIII Reconstruction Editor has reoffered pratuitously to the public, the correspondent not caring to develop has that for the inventors to do Such were the suggestions published in our moue of Junuary under the heading, "A Safe for liberty Bonds Through an over-

Stock shots and bos-holder

omitted We take this opportunity of announting that it was Mr A H Berwal of Wilmington, Delaware, who furnished the suggestions

The following letter has been received from Mr A K Jackson of Toronts, Canada, who suggests some long-needed improvements in the meat packing in-

The requests that have been made through your columns that articles for manufacture in over-equipped plants, be manufacture in over-equipped plants, be submitted, leads me to suggest two very real necessities which would find large sales in the packing houses. Having had 14 years experience in the packing industry, I have been in a position to observe present methods of handing meats and their by-products, and am positive that these articles would meet with favor

' The first is a traveller for beef rails equipped with a clutch instead of the crude block now in use. I have seen hours of valuable time wasted in removing these books from frozen beef, it taking two and sometimes four men to handle one-quarter or side of beef from the rail without accident By the use of a by the man who must carry it, by merely rousing it on his shoulder 3 to 6 inches above its normal position

My second suggestion is an automatic for sectioning sides of hogs This work has always been done by hand This work has always been done by hand except where the band or circular saw is used. The saws are not satisfactory, however, as they draw the bone dust and marrow into the most. With a mechanical cleaver it would be possible to get a straight clean out in exactly the spot where it is required, with one stroke, leaving the operator's hands free to good it. feed it

The cleaver should be made to remain in an upright position when the stroke is finished, in other words the action should be down and then up, instead of up and en down as is the case with automatic

hammers
"It would naturally take a very powerful stroke to seve the ribe in dividing the side from the back of a heavy hog, but by using a weighted cleaver with powerful springs drawn up by a system of gears, and rulessed by a trip arranged m connectous with a foot lever, it should be possible to make one stroke to flams seah out." stroke to frush each out.

# Wanted: a Manufacturer for an Improved Table

THE Editor is in recept of the follow-ing communication and will be glad to forward replies to this letter to the com-pany which is now engaged in manufac-turing these tables

e have read with interest some of the articles in your reconstruction di-vision, and would say we have a patent table serviceshie for either library or

vision, surviseshle for either survey, dining purposes

"This table has been on the market about three years and is selling freely However, we saw at a great dandvantage. Traight rates, and distances are considerable specific trains, and distances are considerable specific trains, and distances are considerable specific trains, and the specific trains are specific trains. The specific trains are specific trains are specific trains and the specific trains are specific trains and the specific trains are specific trains and trains are specific trains.

In strong contrast to the Bettery Don'ts is the one Magneto Don't:

1. Don't Worry

The MAGNETO always does in duty useder the most exacting conditions of speed, climate or load on sirplemes, peacen ger cass, rucks, treators, motorcycles or say other internal combustion enguse. And the only stemation is requires is two drops of oil every two weeks.

Aero
MAGNETO
MAGNETO
MAGNETO

The AERO Magneto was designed and perfected by Splitdorf engineers for the extremely severe service on war airplanes.

It was standard equipment on American arplane engines as well as other arplanes of the U. S. and Allied Governments. And its reliable and efficient performance on these airplane engines and on thousands of heavy transport trucks under actual fighting conditions place it far in the lead of all other ignition systems. The AERO Magneto for passenger cars and trucks offers an ignition system that is without fault.

DIXIE Magnetos and SUMTER Starter Couplings are standard equipment on the insjective of tractors and on many trucks of the leading manufacturers, while SUMTER and DIXIE Magnetos are popular equipment on stationary engines.

 Don't forget to put water in your battery every week

2 Don't use anything but distilled water

3 Don't let the electrolyte spill on top of battery

4 Don't have an open flame in same room with a charging battery or an open battery

5 Don't permit battery to stand without a charge

6 Don't allow sediment to collect in the cells

7 Don't fail to keep the terminals tight

 Don't connect terminals to the wrong poles
 Don't let terminals come in

ontact with battery box

10 Don't forget to test with a hydrometer at least once a

11 Don't let your battery become over charged

12 Don't permit plates to become buckled by lack of water

13 Don't forget to turn off your ignition and light switches when you stop your engine or your battery may run out.

## The Current Supplement

MUCH interest inheres in the tremend ous preparations which the United States had instituted for a gas offensive which would throw completely into the shade anything that the Huns had ever attempted and make them sincerely regret that they had ever started this kind of warfare Manufacturing operations were at the time of the armstree being carried out on a scale truly appaling. The timely story of this work is told in the ourrent issue of the Scientific American Suprimerary No. 2236 for March 22d. under the title Gas Offenswe, A Record Achievement In the same issue a native of Poland and student of Polish history gives an illuminating account of The Nord Forces of Old Poland An important dis-cussion of certain aspects of the crystalline and colloidal states which have heretofore received little attention will be found under the rather awe inspiring title Dispersord clopy An illustrated account of the manu facture of wall paper covers a field which is but little known to the average mortal The mathematically inclined will follow with pleasure the discussion of Stream
Line Motions and Water which carries three illuminating diagrams A surgeon in the I mited States Public Health Se details his observations upon the Flight of Mosquitors through Horizontal Water I spis making some significant suggestions regarding the propagation and prevention of mosquito borne discase The article on issue The important work of the Federal station of areas naturally desert or burned over is described and illustrated in Trees for the Descri in addition there are numerous shorter articles of interest

# The Miami Conservancy Flood Prevention Plan

(Continued from page 283)

(Continued from page 233)

The advasshipty of putting a system of reservoirs in the flooded territory was carefully considered and rejected The failure of the I orane Reservoir in 1913 showed the inefficiency of such a system and no practical network could hold in check. The vant amount of water increasary for protection The engineers finally decided upon five immense retarding basins in different points of the Minns Valley and extensive channel improvements. The it tarding basin or dry basin was better because the farm lands in the basin will be wet the shortest time the basins will be quickly ready for new service in the event of a second storm following the first in close sucrosson during the early part of a storm the beans will be empty and avail ablo to capacity for storing the crest of the flood and the dame being for the creat part of the time will not be so likely 11 become damaged as they would if cou stantly subject to the wash of the water. The retarting beans are coperially good for this kind of work. They are in brail branch of the Great Minni system, how, an enormous dame across the lower portion. These dams are provided with large course. close succession during the early part of a

These dams are provided with large con duts to accommodate the steady fit w of the stream. The conduits are placed at the extreme level and made like long tunnels of huge blocks of concrete based of

hving rock
Lach dam is pierced by two to four such bach dam a pierced by two to four such conduits permanently opened, located at the base of the dam. They are to pass the normal riverflow and in flood to discharge water under head No gates, stopiog notehes or other closure devices are present to encumber the dam. The entire system works allogether automatecelly. The en works altogether automatically. The trance of each of the conduits is prote from drift by concrete piers and a floating

Enormous volumes of water will be dis charged from the conduits at the maximum flood. They are so proportioned in rela-tion to the drainage area and basin as to

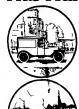

# The World's Most Efficient Small Motor

The small, light-weight, efficient gasoline motor sets new standards in design, manufacture and service of interest to everyone

The Spacke Motor, shown above is a practical power plant-proved by service -thousands are now in use

It actually weighs less than 100 pounds complete. Yet it easily develops from 9 to 13 horse power on less than half the gasoline consumption of the average gasoline engine

let the hasm all approximately to spillway | Resi Estate, other than in Port in the assumed maximum food Than The Banne spillways, which probably will never be Public Utilines, Relocations used, are provided in case of emergency. And Damages They have from 15 to 19 feet freeboard below the dam crest as a safety margin, which amounts to about 40 per cent over the maximum flood. In floods twice as the maximum flood. In floods twice as large as that of 1913, the dams will have a freeboud of about 15 feet, determined upon the height of the dam

Of the five retarding basins, three he immediately above Dayton in the main streams that join within that city The Taylorsville basin is on the Miami, the ood on Stilly vater, and the Huffman Engia od on Statiwater, and the Atlantana on Mad River These limit the extreme concentration that takes place at the base of the main part of the Valley This section has a very high concentration rate due to the tan-shaped arrangement of the rivers oming together here and the straight

supply channels
Of the other two retarding basins, Lockington controls the Upper Miami, protecting Piqua and Troy, while the Germint wn basin on Twin Creek protects Middletown To develop fully the probably also be affected Similar con-dition apply to the Huffman basin where the cost of more radical adjustment would

It will require three years to build the Englewood basin, the largest of the projetts and three weeks for it to empty a maximum storage It supplements the Hulliam and laylorsville Banns vitally, because it reduces Stillwater River at

of water at high spouting velocities with-out damage. The Taylorsville dam, which has the largest conduits, can discharge 55,000 cul s feet per second, nearly as much as the present safe flood-flow capacity of the Miami Channel The velocity of the discharge had to be brought down from some 50 feet per second to six or eight feet by use of the hydraulic numr standing wave, stabilized by steps and tailuster were

The construction of the retarding basins and the terror of the lockout, these a necessitates the purchase of much splendid farmland and the changing of many miles of railroad track. For the Huffman basin of milroad track. For the Huffman basin the mun line of the Eyre Railroad will be changed for 80 000 feet and the Oho Electric Railway for 67,000 feet for the Invloreville basin, the B & O Railroad will be changed along 65,000 feet, and the Big Four along 15 miles. The word commenced over five years ago and will probably be finished about five years from the time. The state of the control of t from the time The total cost of the propert will run about \$25,000,000 and will be raised by special taxation graduated proportionately to the benefit The whole Minn: River Valley will be influenced. The rich land within the basins will be leased and cultivated as heretofore, the ses alone being moved to higher ground The fact that most of the land will probably never be flooded makes cultivation a good risk The following table, showing the cost of the main items of the work, will give an idea of the disbursement of the

(Continued from page 284)

no less pressing now than ever The difference is that now labor has a share in difference is that now labor has a share in the working out of the policies which will avoid such difficulties, and can aid in shaping the destinies of industry as well as of trades unions, to the mutual advantage of nation and worker, whose previously labor could but recent after trouble had come, or suffer after injustice had been

As has been sketched in previous artucles in this series, the provenment is endeavoring by every means in its power to discount that dreaded period of transition from a war to a peace basis, and to beep a sense balance in most sminds by many means, chief of which is an unsemployment benefit of 24 shillings a west for 18 weeks during the six months beginning November 2548, with additional sums for dependent chiff-dren Demobilisation is not to be carried out at a speed which will paralyse industry's ability to resbesch Recognition meanres are tadder way that will start up many public works, that will start up many public works, that will solve to some creater at least the very pressung housing problem, that will produce new sources of wood argusty by reformations. As has been sketched in previous articles new sources of wood supply by reformatation, that will both reclaim land now wanted and

You Can't Figure the Cost of Power by Figuring "Power Cost"

Even the most carefully compiled "Power Cost figures may not tell all about the cost of power in your factory

You may know just what fraction of a horsepower-hour it takes to turn this piece or grind that one, and exactly what that power costs in dollars, cents and even to the fraction of a cent

You may know exactly the cost of power you lose through idle machines—through friction and through long lines of shafting and belts

But it's harder by far to figure how much inadequate or worngly applied power is costing you, or how much you lose from inability to run each machine at exactly the proper cutting speed, which can be so easily maintained in the motor driven shop

Moreover it is extremely difficult to determine how much spoilage comes from the imperfect control that is unavoid able where electric motors have not yet come to replace long lines of overhead shafting

Cost of Power" can always be decreased by the right motor installation. To be sure that you get the proper type and size of motor for your requirements call on Westinghouse engineers. They are always ready to give their advice and, make recommendations based on your particular set of conditions.

make available for cultivation land now held in parks and estates that will in a hundred other ways directly affect the comf it and the life of the individual Adult education is getting much attention Adult dutation is getting much attention as at extension courses for soliders in proc so if demobilisation, and a general attempt is being carnestly made by the entir government to bring capital and labor industry and craftsman, to a state of mutual confidence and mutual for-bearance during the difficult years just

How the problem will finally find solution no man may guess. But labor as a class has so whole-heartedly and so magnificently got on with the war that to the onlooker from another land, it does us as if the government had been wise seem as it the government used been when in time and as if it were not possible for labur as a class, either to raise the snake-like head f Bolshevism or seriously to em-barrass what they naturally consider to be the gratest nation in the world, in her progress towards a newer and a better national life

# [How Will the Gasoline Engine Develop?

(Continued from page 285)

soon reach a temperature at which they would lose their strength and disrupt As for the 38 per cent of heat that passes out through the exhaust pipe in the form of gas at high pressure, attempts have been made to utilize it by expanding the gas a see nd time in a larger cylinder-as is done in steam-engine practice, likewise by giving the piston a variable stroke, the intake being short and the expansion stroke proportionately long to carry expansion to a comparatively low pressure. These and other expedients have been more or less exhaustively tried out but they have added so much weight and complication and noise and expense that none has ever got much past the experimental

Such roughly, is the present state of affairs Suppose we consider for a molooking toward greater efficiency. So far as thermal efficiency is concerned the best results are obtained with a single cylinder Sweeping all detailed discussion aside however the single cylinder engine is im practi able as we now know it for anything

except stationary and heavy marine work
It is apparent however that the ex
pedi at of multiplying cylinders is simply the cassest way we have for making the the matter and channating the evil present tendency toward designs in which each mdividual cylinder is brought to a bigher efficiency. One automobile manu-fa turer has succeeded in increasing the maximum power of a six-cylinder engine appreximately forty per cent by using two intak and two exhaust valves instead of the usual one and has mercased the overall office new about thirty per cent all by just mains, it cases for the gases to get in and out Similar and equally good results have been brained by makers of four cylinder ones Higher power greater flexibility lier fuel consumption all have been obt med without increasing cylinder di

velopment of another method of lubifor-tion, is something that holds out further-hope. As a matter of fact there is available a lubroant that remains unaffected able a lubroant that remains unaffered by any such temperatures as are attained in internal combustion sengines. I refer to graphite, which is constaintly finding new uses and extensions of eld uses it has a strong simility for east root, and the davelopment of means for using it in cylinder lubriation does not seem impossible. This would permit a working interpretute probably higher than present cost trons would stand. Should this some cost trons would stand. Should this some trans it would be un to the metallurseists. to pass it would be up to the metallurgists to produce a metal that would support the

temperature Another point here the running of an engine at temperatures considerably higher than at present possible would probable eliminate water-cooling, it would be a matter of annal difficulty to carry off, by air alone, the heat that could not be converted into power Perhaps it could even be done without the weight-adding fins and flanges that are now necessary cooled cylinders

One result of such a development w One result of such a development would be greatly to reduce the weight and size for a given power output. In the case of the automobile engine, this would have unportant effects upon the design of the car as a whole At present the chassis must be strong in proportion to the weight of the engine. The lightening of the engine would permit the lightening of the engine would permit the lightening of the whole ear A case in point is that of a manufacturer who, a few years ago, worked out an engine with an aluminum cylinder block, in which light east-iron liners took the wear of the pustons With-out reducing the power or the capacity of the car the weight was cut down more than helf. See the control of the capacity of

While on the subject of weight it may be pointed out that there are great possibilities. pointed out that there are given pointed the in the much neglected two-stroke cycle points the way it is highly probable that had this principle been adopted as has the four-cycle bad it been the subject of the same general concentration it would have developed into something much better than any tlung we now have The four-cycle engine has been so close to our eyes that it has been difficult to see anything else, but its further development along its present lines appears to offer opportunities that are small in comparison with those of the able to assume that at no distant date the latter will be taken up by the engineering world more seriously than here

Already we know that it is entirely possible nearly and in a few cases actually. to double the power of a ryinder of given dimensions by substituting the two-stroke cycle for the four. This would not scroce cycle for the four. This would not mean cutting the weight in two, for the shaft, connecting-rods and case must be sufficiently substantial to take the additional stresses But carry the matter to its logical conclusion and let one cylinder do what a steam-engine cylinder does provide an impulse at every piston stroke, two impulses for every revolution of the shaft Or we may leap boldly over a whole catalog of its and buts to foresee, as one of the engines of the future, one with a single cylinder working on the two-cycle prinplosion at every piston stroke

mere sine. Much hase heen and is being don't be controlling heat which means don't be controlling heat which means the state of the properties of the proper This would involve something more

# Frederick Palmer in Collier's

Palmer was in the unique position of a veteran war correspondent serving as an official observer with the rank of lieutenant-colonel.

The knew what to see, and he saw it! No one man at the front saw more of America's army and its wonderful work.

¶ His story—a series of complete and accurate articles—begins in Collier's for March 22nd. Read them for an interesting, reliable account of America in action.

> Colonel Palmer's series typifies the articles which you find regularly in Collier's-authoritative, concise, vitally interesting, Besides Colonel Palmer himself. the writer of these articles (associated with Collier's for many years), are Mark Sullivan. Arthur Ruhl, Samuel Hopkins Adams, Richard Washburn Child, Edward Hungerford, and many of similar standing.

# Collier's THE NATIONAL WEEKLY

More than a million every week

two-senter, these machines are singleis a two-searer, these mashines are single-metters. It is hoped that at an early date these various machines will compete in a race which will soon establish the undus-puted supremise of one of the three types, unce it is obvious that all three cannot lay claim to the same title when all the figures do not agree. And again, it is not so long ago that 150 miles per hour was considered the god of the fast plane. It seems rather den for planes to have gone up to ove 160 miles an hour. The more skeptical among laymen demand actual and official ligures rather than mere estimates

Turning from the military planes to sport or civilian planes, the visitor found much of interest First of all there was the bisarre little Gallaudet twin-pusher monoplane known as the "Chummy Flysbout"
This plane has a span of 33 feet, and is equippe I with two-motor-cycle engines of 20 hr -power each. The engines are used t gether in driving the pair of pusher used it is there in cirving the pair of pusher propell r- but should one engine fail the other would continue to drive both propellers through a system of shafts and bevel garring. Two sexts are provided in this sport plane arranged side by side just this sport plane arranged more by side just behind the two engines in the nose of the monocynu fuselage Light gallons of fuel 1 carried which is sufficient for a two-hour flight. The machine weighs 750 pounds but the designer states that it will soon by reduced to 690 pounds as a result soon is reduced to not pounds as a result of certain improvements and modifications With full load a speed of 40 to 80 miles an hour is claimed for the Gallaudet 'Chummy Flyabout' The cost is \$3 500 at present

Another sport plane is the Dayton-Another sport plane is the Dayton-wright 1-4 Messenger, a war machine made over for ervilian use. As a military machin: it was intended for carrying messages from the frunt lines to hasd-quarters and for general lasson work. The Missinger is a conventional bi-plane with a wing span of 19 feet 3 inches a wint of 675 nounds loaded, and extracplane with a wing span of twicer a money a weight of 636 pounds loaded, and carries an air coded De Palma engine of 47 horse power. Twelve gallons of fuel is carried which is sufficient for a three-hour flight The machine has a speed of 85 miles in hour and can climb to 5 000 feet in ten minutes according to the manufacturers s machine sells for \$2 500

While not intended at the present moment as a sport or civilian machine, the Loening M-2 baby sesplane, which has been used by the Navy for submarine patrol work is prhaps the smallest scaplane ever luit for practical work. It occupies so little space that it can readily be packed aboard csubmarine. It is a tractor monoaboard tsubmarne. It is a tractor mono-plane with two floats. The plane has a span of 1) feet and a chord of four. The engine is a three-cylinder Lawrence 60 horse-p wer air cooled. Twelve gallons of fuel is carried which is sufficient for a two-hour flight I ully loaded, the maximum weight but 500 pounds. The inaximum speed is said to be 100 miles an hour, and the lowest 50 miles an hour.

To one unfamiliar with the broad and highly telinical subject of aerodynamics, the matter of horse-power and speed seems most purpling and inconsistent. On the one hand we find a single-seater military plane making 130 miles an hour with a 300 hors power engine, and on the other a smiltr plane making 80 with but 40 horse power who such a prest difference in his procure in his programmer. The answer is that horse power and speed do not keep in perfect step. That is to say, as the speed demant in treases, the horse power of the second demant in treases, the horse power of the second demant in treases, the horse-power does deman i mereases, the horse-power does not rise in arithmetic progression, such as 1,2 3 and so on, but in geometric progression, such as 2 4, 16 32, and so on Every 10 miles above 100 miles an hour calls for 10 miles above 100 miles an hour calls for tor there draws out a thread to mark the a vast increase in horse-power, until 300 line of direction between the ship and the mand 400 and more horse-power is required compass station. As the other bearings are when 150 miles an hour is reached. That imported, similar marks are laid down; it why a will-described similar state of the discourse termination.

New York's Aeronautical Expection power, whereas it requires eight and system times that power to double the specific power.

Acrial luxuumne, or enclosed multi-se Acrial impossine, or enclosed mater mesor planes, were shown at the Exposition, with elaborate fixtures and numerous comforts for those who desire to fly rather than ride from place to place. In fact, this matter of aerial limousnes indicates how military planes of the two-seater type can be readily converted into social machines, with little trouble and ex-

That naval aggraft have kept up wi That neval aircraft neve upp up with military aircraft, despite the rapid ad-vances of the latter, is quite evident. The Exposition disclosed high speed single-seater naval souts with speeds closs to those of the regular run of military airplanes Then there are the buge anti-submarine patrol eraft, such as the Liberty engined biplanes of our Navy, constructed at the Naval Aircraft Factory in Phila-delphia. In fact, when the matter of civilian flying is considered from a really personal point of view, nine chances out of ten the seaplane and the flying boat types are the most attractive. The starting and alighting problem is far simpler with aquatic aircraft than with

simpler with aquatic aircraft than with those which land on solid earth. Four and a half years of war have given us several reliable power plants for our airplance. The necessity of detecting and reporting enemy movements, defences, gun emplacement and so on hes given us a large collection of cameras and wonderful photographic apparatus The demands of military aviators have given us excellent aeronautical instruments for measuring altitude speed, drift, inclination and so or all these things were on display at the recent Laposition

If the present design of the surplane is to be accepted as final, then the airplane is practically perfected. There seems little more that can be done in the way of spec-tacular advances, for the present machines carry great weights, can make high speeds, climb thousands of feet in a few minutes,

and are quite rollable, especially in the case of the multiple-engined planes

btill, when it comes to long distances and sustained flight for many hours, the dirigible will no doubt be the craft adopted for commercial purposes. A daugible us-ing helium gas is practically a perfected eraft, it can be made 800 or 1,000 feet long. with a diameter of 80 or 100 feet, it can carry 20 to 30 tons of useful load, and it can readily be made for a cruising radius of 7,500 miles! For inter-continental transportation for trans-oceanic flights, and for long-distance travel generally the dirigible is the craft of the future. It can handle passengers at a far lesser cost for distances over 500 miles When it comes to short lower 600 miles When it comes to short journeys, however, say between London and Paris, New York and Washington, sad Paris and Brusels, the large airplans, capable of carrying twelve to journean passengars, is undoubtedly superior be cause of its high speed over routes where Yearns and fast tessmers have to be com-peted with 80 for "lops" or short lightle, the surplane is destined to be the winged carrier of passengers, mails and light merchandise, while for long journeys the airship will no doubt be the uncha lenged transport. It is a far cry from the captive balloons and small Naval dirigible exhibited at the Aeronautical Exposition but to those who have been following the march of aviation events there is no doubt that they represent the opping commercial

to ran outlaw planter to tuck away a few
acres of cotton in some nook of the weods
beyond the probability of discovery ty
ordinary means though the Department
of Agriculture was making deligent efforts
to apolt every stalk of cotton in the quarantimed area. ed area

Last year the Department took ad vantage of an offer to try out the airplane for this acouting work. With its aid seven outlaw cotton fields were discovered in the heavily wooded country along the Trinity River and around Galveston Bay fields which had escaped discovery by all

other means Similar exploration and control work h since been extended and will doubtless be continued as long as the cotton quarantine exists Photographic maps have been prepared of the entire district between the Brases and Neches Rivers and have been liftages and Neches Rivers and have been found of great service in keeping this area under survey and observation. Panofamic views of the country bordering the quarantine lines are made to note the character and extent of any forests or wooded areas which might act as a natural barrier to the spread of the bolloworth through flight the moth as well as to secure some idea of the value of aerial observations in con nection with entomological work and

ar outing Flights were made at an altitude of 1 500 to 2 000 feet. At this elevation on a cuarray distinct vision could be had of the country over a range of 30 miles and oul tivated fields buildings shell roads, rail way lines creeks and the character of wooded are is—whether evergreen or de-aduous could be easily distinguished. At the normal airplane speed of 75 miles per hour the ground moves so slowly, when observed from this height that the observer has time to get a complete picture of the area and to make an easy distinction between outton and corn-fields

After reporting in detail on the natural in his belief that the airplane will tre-mendously facilitate all such scouting and amounts and a near development of the control of th nee work including mapp putting before the violator of the law and threat that an eagle-eyed officer of justice may drop upon him at any moment from the sky, the new undertaking seems to be of coundwible permanent scientific

# What Came of a Letter—and a G.T.M. Call

\$123.83 has been saved in seven months on the draft-fan drive of the Darlington Clay Products Company. The best belt they had ever had on that drive gave service at a cost of \$25 32 per month. The Goodyear Belt recommended by a G. T. M.—Goodyear Technical Man—has cost only \$7.63 per month. In the last seven months, therefore, the G. T. M.'s service has saved \$123 83—and will save more in the months to come. Even more important to Mr. Teffit, the manager, there is no more trouble on that drive. A letter of inquiry written to Akron by Mr. Tefft was the first cause of these gratifying results.

In it he described his draft-fan drive and the trouble and expense it was causing. He wrote that the belt ran between the brick walls of a pit—coming to within an inch of walls often at a tem perature of 300 degrees. He stated that sulphur fumes—SO2—went over the belt, and that the inghtman in oling the fan bear ings generally let oil drip on the belt. He added that the best belt he had been able to get gave about 8 months' service at a cost of \$202 61—\$25 32 per month—and lots of trouble and repairs thrown in for good measure

We sent a G.T.M.—our Mr. Hunter—to look the drive over He decided that as it stood it would always be expensive and troublesom—even if Goodyear Belts specified by a G.T.M. were used. So he put up as oil guard at the right place—had a hole cut in the wall to provide a draft to carry off the heat—and after careful measurements specified an 8 inch 5 ply Goodyear Blue Streak made endless. It cost \$53.41 and was applied June 5th, 1918.

On January 5th, 1919, at the time this advertisement went to press the belt was still running. It had given seven months service at a cost of \$763 per month—had never required repairs or other attention, and to Mr. Tofft looked good for months more of perfect service. It does better work than the former belt which cost at least \$17.69 more per month of service. Mr. Tofft attributes the consequent saving of \$123.83 in seven months, and the relief from trouble to the C. T. M. he has had a G. T. M. analyze and prescribe a belt f revery driven in the plant and has already ordered the pres nibed Goodyear equipment for five drives.

If you have a belt devouring drive that is eating too many dollars ask a GTM t call. Hell do it without charge when he in your vi. iv. There are many of them, all trained in the Goodvear Techr. al. Sch. 1 all with experience in plants similar to yours all sed in, belts timeet conditions and not as a hard ware mish sells in his. We are able to give the GTM is services free only between the savings they effect for purchasers are so considerable that a trainfying volume of business from the plants analyzed is sure to result within a year or two. The G.TM. sanalyzes and prescriptions do not obligate you in any way.

SCIENTIFIC AMERICAN

Vol. CSEX. No. 13 Minch NO. 1918 Scientific Amer Publishing Co. Mana & Colley York, N. Y. Price 10 Cents

'Nobby Cords' are big -husky-incredibly strong.

Layer on layer of tough, powerful cords from a tire wall that is virtually impervious to wear—a perfect base for the great thick non-skid tread

Each layer of cords is imbedded in live, springy rubber This gives a flexibility that robs the road of its roughness, cushions the load and lets you speed up your truck with safety Twenty miles an hour, if you like, even with fragile loads

'Nobby Cords' will cut costs in many other ways

By absorbing the impact of the road, they keep

your truck out of the repair shop, lengthen its life and reduce replacements of parts Many users estimate that 'Nobby Cords' reduce depreciation of their vehicles 50 per cent

Naturally enough, the smoother operation of the truck saves materially in gas and oil consumption—frequently as much as 30 to 40 per cent

Nobby Cords' can be put on or taken off, same as the tires on your passenger car—and with as little trouble or delay

Our nearest Truck Tire Sales and Service Depot can supply you with 'Nobby Cords'

# A Towing Burge for the Huge Naval Planes

A Towing Starge for the futge Naval Planes

AVAL switch was developed to a far greater extent

during the war than the public was permitted to

believe Unitte unitary avistion, where the developments and tenisences were more or less known to the

world at large during the war, neval avistion has been

eashrouded in the blackest and most impenetrable anoke

earem of the cenors, indeed, it is only during the past

few days that the facts are becoming known as regards

the winged branch of the naval forces
Along with the diminutive Sopwith single-scater biplanes which the British Navy faunched from platforms erected on a pair of long gans of any cruser, it is now divulged for the first time that both British and American naval forces made use of and American naval forces made use of towns barges or lighters for transporting big escalance to distant points. These barges reved the purpose of towns gea-plance to somewhere usar enemy points, by means of fast torped-boat destreyers, so as to lessen the flying distance. It will be noted from the accompanying distantance, that these barees follow the

It will be noted from the accompanying illustrations that these barges follow the usual hydroplane lines: A compartment at the rear of the craft as employed as a trimming tank, which is blowed out by compartment in the company of t

on a pair of rails. This trolley is composed of two parts the after part being hinged to the foremost or main portion. The forepart is carried out en flanged rollers each 3 inches in diameter and 2½ inches wide on the bearing surface. The top of it framework of the eradle is laid with portable sets of fir buttens. Clips to prevent the trolley infung from the rails are provided. Also four automatic binged catches are precised of reholding the results in the second processing and the storing the results. the eradic in the receiving posit on and in the stowing position

From what has already been read at will be noted that

the scapiane or flying boat is stowed on the cradle running on the fore and aft rails on the inner bottom of the lighter on the fore and aft rails on the inner posters in the tradic is run down.

To ship the flying boat or seaplant, the tradic is run down. to saip the nying one or seapant. Lit oranie for in the trails to the extreme after end of the lighter. The later is then frimmed down aft by flooding a water balliast compartment by means of a kingston valve sufficient draught of water being obtained to allow of the flying boat or scaplane bung floated on to the cradle

the cradle with its load is now hailed up the rails by means of the hand windless at the bow to the stowing position which is approximately midships where it is secured. The water in the ballast com-

partment at the rear is then blown out by compressed air stored in bottles carried on board the lighter bringing the traft to an even keel for towing. The towing eyes are fitted to each side of the barge some distance back from the low in bridle being used. By this me ms any trudency for the lighter to deviate fr in her true course is corrected by one or the other of the legs of the fruile bearing on the forepart of the lighter and thus bringing her back to her Three skegs are fitted aft for the same purpose

It is said that these lighters have been towed by destroyers at speeds up to 35 knots with flying boats on board. To knots with fixing boats on board. To privent the fixing boat or maphair as the case may be from lifting off the trolly when the barge is being towed at high speed two wing supports are provided at each side. When the desired point for making an attack is reached the plane is launched byreversing the loading operation. In the upper illustration is depicted the method of shipping the seaplalane while the lower shows the barge under way

from speed despitute on beard a barge which is towed sometimes at the rate of 65 knees an hear ,

# Hurley and the Shipping Situation

HF Chairman of the United States Shipping Board returns from his three months stay in l grope with a mass of first-hand information regarding the shipping situation in the maritime world, and the American public will be glad to know that one offect of his investigation has been to make him very optimistic as to the future of American shipping. He believes that the obstacle of mexperience will quickly give way before American industrial strength and energy Our progress will be facilitated by the widespread upheaval which has occurred in the maritime world evidence of the changed conditions he makes the startling statement that the difference in wages here and abroad is today practically negligible the pay given to British seamen during the war being \$72 a month as compared with our pay of \$75 a month Furthermore, ould have us remember that wages form only a part of the assues now raised by the seamen of the world He found that the conditions of living for the seamen aboard ship and the recognition of their rights as citizens, even upon the sea overshadow the wage question own Shipping Board has provided comfortable quarters

"fit for Americans to live in—and says Mr Hurley.

The seamen of other nations as I found during my stay
abroad, are infinit upon obtaining the same treatment
aboard ship—Ano live rifect which will undoublictly
be of great assentance to our increhant marries was the
action of the Commission of International Labor Legislation, appointd by the Piace Conference at Paris which
has accepted the principle of uniformity throughout the
world of seamen a wager

Fyeryone is interested, or should be, to know exactly what has been the effect of the war upon the shipping tonnage of the world and Mr Hurley a figures may be taken as the latest and most accurate. From them we learn that the steam scagoing merchant tonnage of the world in July 1914 was 41 225 000 gross tons that there has been a net loss of 4 245 000 tons and that to this should be added the loss through failure of normal increase his new construction of 12 000 000 tone making a present world shortage over what would have been atloat had the war never occurred of 16 245 000 The losses to the Albes and neutrals by emmy action by marine risk and by capture or seizure by the enemy, amounted to 15 218 000 tons. The Allied gains during the war were by new construction 11.856,000 gross tons and by capture or seizure from the enemy 2 39 3 000 gross tons making a total gain of 14 249 000 grass tons. The act loss therefore to the Albes and nentrals was 969 000 tons

The figures for the gross losses to individual nations frough enough enough ston are very impressive. Out of a total for the Albies and neutrals of 1.2815 000 tons for all Bittain lost 7.75.74 figures tons. Norway, 1.178.15.5 tons. Franc. 907.108 tons. Itals. 852.124. tons and the United State 81.698 tons the percentages warsing from 46.8 per cent for Great. Britain to 7.2 per cent for the United State of the State of

During the war Great Britain built and acquired auffactors formage to reduce her net less to 3443,000 tons and during the same period we increased dur shipping to the extent of 1370,808 tons. As the result of his survey of the British pacies, Mr. Burley resolved the emissions that under favorable conditions the British may reach or evem accord the \$,000,000 gross tons output producted for 1919. Micrower, in found that France, Japan and Rally have asabilitims programs of construction for the British of the British

I maily it is Mr. Hinter a count is not that if the natural and describle reparation of the for just rate of the United States is to take place, three conditions must be fulfilled States is to take place, three conditions must be fulfilled First to distribute American justifiert and bring in imports through American age is en and largely in imports through American age is en and largely in terporation of the place of

# The Humanity of Poison Gas

To view of the feelings with which (ivilianton received the news of the first point on a state), in which horror and indignation contended for the mastery, there is, at its first announcement, something remie in the statement of our initiary men that poison gos is today a more humane form of attack than higherplower shell. But learn has positionally one of the German horror at the Vpre salient we hasten to add that the humanity of posion gas warfare is not due to the Germans, but to the ingranty of the Allies in providing effective gas-mask and developing suitable undired and hygenic treatment for those who have been gassed. Germany intended the posson gas to be just as horrible in its effects, just as citief and excremance in the ingering deaths imposed at it proved to be

So greatly have the borrows of gas attack been mitgated as more its first introduction, that in the opinion of Braggen Amos A. Fries, who was in command of the Chemical Warfare between of our arms at the front it is posseble that gas warfare may come to be recognized as a lawful method of warfare and that it will not be eliminated. The argument as presented by him is also ondiorsed by Colonel Walker, who is in command of the Edgewood plant for the manufacture of gas, of which we give a desemption obsorber in this issue.

The question of the "humanity of gas warfare is of course closely test up with that of the preparedness of of the war, course closely test up with that of the preparedness of of the war, country for general blude have aboven that are the casualties and permanent impures due to gas strate, the casualties and permanent impures due to gas strate, are far less than those suffered from shrapnel and high are far less than those suffered from shrapnel and high 100 examilies of all kinds suffered by our troops in battle, 100 casualties of all kinds suffered by our troops in battle, 100 per cent were caused by high typlosive shelf, shrapnel bullets, etc., and 30 per cent were due to gas, the gas of course. Some thrown in abelle first of from standard guine

But it a whon we come to the matter of the percentage of deaths to cantaltate, that x denover the surpraning fact that the deaths from gas were only five per cent of the total deaths, or to put it in another way, out of very 100 casualties due to gas three to four dash whereas out of every 100 wounded with high explosive, bullets shrappel, sets, twents to twenty-five dead, and among the deaths from gas are included these from pneumonia and other lung complications due to the patients having hom gassed.

Another accoulled humanitarian feature of gas warfare is the fact that whereas there are 3,000 men of our expeditionary fores who have lost either an arm or a leg from shell and rifle fire and a considerable number who have lost their aight, got a single man of our troops has been pormanently blighted by gas

As pointed out by Col William H Walker, who is better known to our readers as the Director of the Institute Course in Chamical Engineering at the Massasetts Institute of Technology, gas warfare to effective, largely because the troops that are subjected to centure expount to gas and, therefore, have to wear thair masks for several hours, love a great deal of their efficiency, went to the extent of rendering it ascessary to censore them from the gassed areas. It was the heavy gassing of the back carea, and particularly of the receive troops back of the British front lines, resulting in loss of efficiency among those troops due to their having to wear gas masks, that contributed so largely to the German success in the great drive of March, 1918. And the slowing up of that offensive and its ultimate loss of driving power were

due largely to the fact that the Germans ran out of gas If these facts are well established, and they rest upon the highest authority, it becomes a question whether a prudence and fareaghtedness do not suggest the maintenance of our great gas factory at Edgewood Aresual as a permanent mullitary asset of the country If a small and there, we should have at hand capable of mimediate to operation, a military asset far exceeding in its potential time anything of the kind on the world today.

# England to France by Rail

T was mevitable that the close of the war would see a revival of the discussion of the proposed tunnel under the English (hannel, but there is this difference between the project in pre-war and post war days-that today it has behind it all the driving force derived from the urgent need for such a tunnel that has been revealed during the 414 years of the great war League of Nations or no League of Nations, it is accepted on both sides of the Channel that the construction of the tunnel would greatly strengthen the alliance between the French and British nations though the cross-channel service maintained by the British navy during the war was a magnificent feat of transportation, the existence of a double-track rail connection would not only have vastly facilitated the flow of troops and stores from Great Britain to France, but it would have saved enormous sums of money and much valuable time

In all the years through which the agitation has been carried on, more or less intermittently, for the construcson of this work, the scheme was handicapped, fatally handicapped, by the reluctance of the British people to permit the construction of a work which they feared would destroy their absolutely insular position The objection was largely a sentimental one, and it has been completely obliterated by the bonds of good feeling that have been forged by the war Furthermore, the idea that the tunnel would expose Great Britain to military invasion was largely a myth, for it would be a very simple matter in these days of high explosives and hubly developed fuses and electru connections, to flood the lower reaches of the tunnel at a moment s notice, or indeed to blow it up altogether

It has been urged that a surpruse landing might be made at the terminal of the tunnel and its supproaches saized and held for the passage of troops. But that would be possible only in the sevent of the prosests negligence on the part of the military authorities. Furthermore, it would be a maple matter to establish several secret stations along the occast and misand, at which the throw of a switch would mean the instant flooding of the tunnel

In these days of ambitious sugmeering works, it is conceivable in this connection, that the Channel tunnel might be followed by one, only a few miles greater in length, extending from the Scottah coast to the Irish coast near Belfast Add to this a port of call on the wort coast of Irishad, and the time and distance consumed in a trip from Americs to Europe would be very greatly reduced.

### Aeronautical

Gothas for Great Britain .-- As soon as the circumstances permit, three of the German airplanes of each rendered under the terms of the armistice will be flown to England for exhibition purposes. The number of airplanes required from Germany is far from having been reached. In many cases the machines were found damaged or deficient in instruments or parts. On the British sector the proportion of large bombing plane only about 20-left by the Germans is very small. The examination of all the planes surrendered has added to the accumulated evidence that in armamout, fittings, and accessories of all kinds British aviation had completely outstripped the German air service. The total er of airplanes collected by the British Air Service is just over 500. About 170 were abandoned in open railway trucks and were left dismantled -- a clear evasion of the armistice terms, and evidence of the hostile spirit in which Germany submits to the inevitable

Britain's Monster Dirigibles.—An audine of the arbship program which the British Administy are reported to have in hand indicates that the giant airships, with a gas espacity of 2,000,000 cubic feet, a lifting capacity of 60 tnns, a range of 8,000 miles, and a speed of 6.70 miles as hour, will be expabled of remaining in the air for a week. They have a crew of 25. Still larger sinkips are projected, and passenger flights are pro-

sed for the near future. The first of those airships will be ready for hunching toward the and of the year. The present record for a British airship, non-rigid, is 1,420 miles, cruised by a North Sea airship in the course of ordinary escort duty. It was in the air for two days and manned by a crew of 15. The size of these airships are comparatively small Airships now being laid are nearly seven times as large. A number of these will probably be used for the government in reperimental postal and passenger-carrying services during the coming number. A regular airship mail service to America, thuring the summer of next year, is regarded as certain by airship builders.

Big Naval Plane for Transatiantic Flight,-There is now being rushed to completion in the Naval Factory at Philadelphia, Pa., what will no doubt be the largest airplane ever constructed in the United States. From such details as have been permitted to reach the press. it is understood that the machine will be merely an enlargement of the present Naval flying boats. It will be known as the Model T. The upper wing span will be 250 feet, which is 124 feet more than the N.C.1 the largest American plane to date. The lower wing will be 25 feet less. The length of the craft over all will be 80 feet, while the wings will be 12 feet broad and 14 feet The Model T will earry five Liberty motors of 400 horse-power each, three being tractors and two pushers. This power equipment is similar to that of Lieutenant Porte's British triplane, which is equipped with Rolls-Royce engines instead of Libertys. It is will seadily carry 75 predicted that the new machine will readily carry 75 passengers, making ample allowance for sufficient fuel all and such other supplies as may be needed for a 2,000-mile flight.

Aerial Goods Service Between England and Beigium .- The Daily Telegraph of February 3d last reports that an aerial freight service is contemplated between Folkestone, England, and Ghent, Belgium. English manufacturers have been finding it next to impossible to ship goods to Belgium by ordinary trans port, owing to the congestion of the docks in that country, and the Aircraft Transport and Travel Company was quick to realise the opportunity thus offered to demonstrate the possibilities of aircraft for commercial purposes. The company has entered into negotiations with British manufacturers interested in the forwarding of goods to Belgium by air The governments of Great Britain and Belgium have been approached in the matter, and the Belgian government has already issued the special certificates necessary for this form of transport. The British Air Ministry has given its consent also to the main scheme proposed by the Aircraft Transport and Travel Company, but stipulated that pilots of the Royal Air Force shall under-take all the aerial trips made. The load carried will be about two tone of foodstuffs, clothing, and other necessities. The extension of this service to Antwerp and Brussels is planned.

### Astronomy

Mount Wilson Observatory No Longer "Solar."—
On account of the continually increasing importance of stellar observations in its program of research, Mount Wilson Observatory has dropped the word "Solar" from its name. This step is particularly appropriate since the observatory acquired the world's must powerful telescope, which will add greatly to the number and range of night observations.

Distances of Cepheld Variables.—Determination of the shability emgetitudes and parallars by the use of the "luminosity-period curve" of 130 Cepheid variables have recently been made by 'shaptey From these measurements it appears that the distances of Cepheid variables are considerably greater than lave been obtained heretofore for individual stars. Less than one-thard of them have parallaxes greater than a thousandth of a second. The most distant Cepheda now known are meanly 20,000 light-years from the sun; almost as far away as the nearest of the globular clusters (about 21,000 light-years).

Statistics of Globular Clusters.—according to Mr. Harlow Shapley, the total number of known globular clusters is 69. Their distances from our system range from 6,500 to 67,000 parsecs, the most distant being N. G. C. 7006. The brightest stars in the most remote clusters are fainter than the 17th photographic magnitude. As to the distribution of such clusters is space, the most remarkable fact is their absence from the distribution of such clusters is space, the most remarkable fact is their absence from the distribution of such clusters in space, the most remarkable fact is their absence from the masses of a typical globular cluster is conservatively estimated to be from a quarter to half of a million times the solar mass.

A Star Occulted by the Martian Atmosphere—
an observation of extraordinary interest is reported to
the British Astronomical Association by Dr. C. Moreton
Bloom, of Porbes, N. S. W. On April 11th, 1918, he
observed with his 41-jach refractor the occultation of the
star 1524 Cape Catalogus (1990) by Mars — The unique
feature of the phenomenon was that the star did not at
any time pass behind the data for the planet itself, but
skirted it as closely that for five mutures the atmosphere
of Mars was interposed between the star and the observer. —Throughout the star's tragential course,"
say Dr. Okon, "its solor padel down gradually from
brilliance to a very faint salum tust, at the same time
its disk enhanced in size and softened down to a blurred
woolly image, as though overmagnified, or as a small
object would appear out of focus."

The Total Solar Eclipse of May 29th, 1919, the path of which crosses South America and Africa, will be observed by two British expeditions sent out by the Joint Permanent Eclipse Committee of the Royal and Royal Astronomical Societies Messrs Crommelin and Davidson, of Greenwich Observatory, will occupy a station at Sobral, state of Ceara Brazil, while Professor Eddington and Mr. Cottingham will observe on the Portuguese island of Principe, 110 miles from the coast of Africa. This eclipse will be notable, not only on account of the long period of totality (6 minutes, 50 reonds in mid-Atlantic and more than five minutes at the land stations), but also because of the location of the sun in a rich field of stars (the Hyades), offering a favorable opportunity for testing Einstein's theory of relativity, according to which rays coming from stars close to the sun's limb should undergo a certain deflection. A smaller deflection should also be produced by the sun gravitation, according to current ideas concerning th nature of light. It is hoped that photographs of stars close to the sun during the cclipse, compared with photographs of the same stars in the night sky, will show whether these theoretical deflections occur. The British observers propose to concentrate their attention on the problem of getting accurate photographs with this particular object in view, and will omit the ordinary investigations of eclipse expeditions Dr. Crommein, who sets forth the plans of the expeditions in Nature (Feb. 6th, 1919), calls attention to a rather serious error in the maps of the eclipse published in the ephemendes. They indicate that the track of totality lies south of the Liberian coast: but totality will in fact, be observable on that coast and under particularly favorable astronomical conditions, weather permitting. Unfortunately the climatic statistics for the Liberian coast are not ncouraging.

### Automobile

Capitalizing Racing Experience.—One of the veterans of the automobile receivards as expensive by going into the manufacture of untermobile tires. The racing man states that be found it necessary to make a special study of tree in order to accord as a racer—in fact, he made it even stronger, declaring that knowledge of tree saved lain from many accidents. The new tree, which is already being manufactured and sold, incorporates many quintos that have been dietated by the expenses of racing, which bringing out weaknesses and structural and other defects in tirre in an amanially whort indicage.

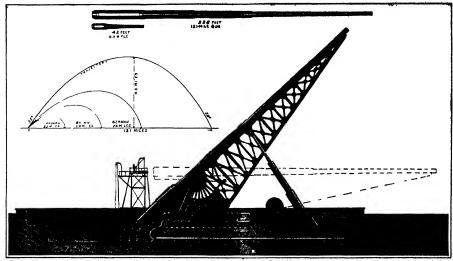

Plans \$259 Automobile.—Again an attempt is to be made, according to wall founded reports, to unanifacture made, according to wall founded reports, to unanifacture and market a small ear to sell at considerably less than the prize of any automobile move available. A unanufacture whose name is known the world over in conscion with low-prized machines as said to have designed a little car and to have expressed his intention of corming stillerally expetisated company to build it. Thou selling price is tentatively placed at something between \$250 and \$450. Itighly standardized quantity production includes a composite of the proposed automobile.

Cheap Care for Europe.—A French company has been formed to build low-prierd care in huge quantities in order to provide for the European market a car that will be the European equivalent of a well-known Ameriean car that a finding a large market abroad. It is said that the car, samples of which have been exhibited to interested parties, is built with European operating conditions in view and equipped with a body that suits European, and especially French, tastes. The engine is small and runs at high speed, having four cylinders 2.8.34 inches The care as whole is said to be lighter in weight than the American machine it is intended to commete with.

Activity in Automobile Invention.—For obvious reasons there was little activity during the war in the development of new ideas in automobile design and construction. Now, however, the art is full of more or less substantial reports of new things that have long been simmering without an apportunity to cume to the boiling point. Among the developments looked for are electric transmissions, kerosene and heavy oil cugines, new ideas in the use of aluminum, true that are puncture-proof and still resilient, simplified lignition systems, etc. As might be expected, the twere-quie engine is asid to be absorbing a good deal of attention, and several and obegins are to be ready in time for noxt vera's automobile

Electrics In South Africa.—It is an ill wind that blows nobody any good, and the ill wind of gasoline shortage has blown business in the direction of the makers of electric automobiles in South Afrea. Electricity is quite reasonable in price, and the generating stations in the larger cities, such as 'Cup Town, Johannesburg, Durban and East Landon, are making special efforts and offering special rates to encourage the use of electrons. The post office in Johannesburg is using 10 trucks in the handling of mail matter with satisfactory results. Here-tofore the derand for electrics has been rather small, but the now conditions that have arisen are invening up the business, the supply will be increased, and it is predicted, the prices will be lowered accordingly.

Stimulating Automobile Buying.—Automobile dealers have noted with considerable uncasiness a tendency on the part of the car buying public to hesitate about placing their orders, fearing that if they do so and pay current prices, there will later on be price reductions; purchasers then would be losers to the extent of the difference between the old and the new prices. The situation has been brought about by the falling of prices following the armstire and the easing up of conditions affecting the materials markets and automobile manufacturing generally. One of the most prominent manufacturers of automobiles and trucks has put into effect a plan intended to counteract reluctance to buy. If a car is purchased and at any time during the current year the price of that model is reduced, the purchaser will be refunded the difference, so that he will be in the same position as one who originally purchases at the lower price

Because of its great kineth the gun 4 lid not be earlied on trumbions. Int would have to be mounted a truss. Our and truss would be availed and depressed by adopting the barpine because of gun 225 ft weight of 250 mas. Weight of power 1 to penned Manale valence; 8 800 flow-seconds. # A 121-Mile Gun

# Ordnance Officers of the United States Army Demonstrate Futility of Super-Range Guns

# By J. Bernard Walker

LONG before the Germans began to throw shells into Paris from a distance of 75 index it was well understood among ordinance officers that such a feat, if any one should care to attempt it was perfectly possible The introdu tion of slow lurning perforated powder and the great improvements in gun steel opened up and the great improvements in gun steel opened up large possibilities of inversasing the range of artillery and the ranges for heavy guns both insval and military, quickly ran up to 15 20 2 and even to 50 miles Because military inen in considering what range to give to their wapons a laways think in terms of military

objectives of limited area such as gun pits crossroads ammunition dumps airdroines, etc. for the actual hitting of which observation from an elevated position or by airplane is necessary no one had thought of building guns to throw shells to such distances as would prevent observation of their point of fall and it took the German onservation of their point of all and it took the German mind in its gradual assent or rather describe morpouson gas to submarine piracy to conceive the its of building a gun that could throw shells in a haphazard fashi in into the city of Paris a target so large that even from a distance of 75 miles it would be impossible to miss its most important centers. The Germans knew that the small size of the shell 8.2 inches and the lack of ob-servation would render the innternal damage done out of servation would remut the insularial damage done out of all proportion to the cost in time mone; and trouble of building and operating a 75 mile gun such as they planned. It was not material but moral damage that the Cormans aimed at and in this as in so many other cases of terrorism on their part. They failed ignorimmously

The Allies built no super range guns during the war-not because they were unable but because they had no wish to 1 bey realized when it came to a question of with to 1 by redird 1 when it came to a question of retaliation for carman bombing and shelling of fortisted etices, that the airplane is infinitely more efficient than the super rang gain that for the cost of one shell dropped upon a city by the gain over one thousand times as much high explosive could be dropped from bombing airplanes and let fall with greater accuracy. It was in order to prove how stravagant in time cost.

and labor is a super range gun in proportion to the damage it can do, that the Ordnance Depunt of the army designed a 10-inch gin which was to have a range of between 120 and 120 and inch with a view to getting Time of first

accurate data on such a gun, its design was proceeded with exactly as though it was to f rm the basis of working drawings and specifications (or construction at the gun factory The results of this investigation are shown

gun factory. The results of this investigation are shown in the surprising sketches and tibulated data of this gun which, by the ocurtery of the Army Ordanaco Deptint, we are permitted to make public. It should be understood, just here that the dimensions of the gun weight of powder slid gun etc. and the general hallistic data are ther. It is of closs calculation. The method of mounting the gut as shown in the accompanying sketch is merely suggestive and was never worked out in any detail Broadly stated the problem is one of burning a sufficient amount of powder in a gun of sufficient length to maintain a m in pressure down the bore of the gun sufficient to proline at the mussle, the enormously high velocity necessary to carry the shell for a distance of 125 miles. With a 10-inch shell of 400 enormously high vestority necessary to tarry one same tor a distance of 125 miles With a 10-inch shell of 400 pounds weight, and a chamber pressure of 22½ tons to the square inch and a muzzl velority of 8,500 foet per second it was found that the ingle of departure which

gave the best results was 55 degrees and that under these conditions the maximum range would be 121 3 miles

An interesting fact brought out by the investigation An interesting fact brought out by the investigation was the determination that an angle greater than 45 degrees would give the greatest range. In previous years with gues of extreme ranges up to 21 miles where the line of flight lay entirely in the lower and dones strate of the atmosphere, it was found that 43½ to 45 degrees but in these of the atmosphere, it was found that 43½ to 30 degrees was the correct angle for maximum range, but in these super-range guns, where the shell quickly passes into the higher rarified atmosphere, it was found that there as a positive gain in increasing the sagie of departure, for the reason that at 55 degrees the shell follows a shorter

the reason that at 55 degrees the shell follows a shorter path through the denser atmosphere, say in the first 10 miles than it does at 45 degrees, and hence it emerges into the upper atmosphere with a higher remaining velocity. The dimensions of the gun are certainly very startling. Particularly in comparison with a standard Elsevick 10-inch gun Its length is 223 feet as against 43 feet, the provider charge goes up from 200 pounds to 1,440 pounds, the provider pressure goes up from 200 pounds, the provider pressure goes up from 200 pounds and the standard gun is 3 000 feet per second, in the super-range gun is 8 500 feet per second, and although the shell is the standard gun in 25 per cent heavier, or 300 pounds the extended gun in 25 per cent heavier, or 300 pounds the shell is the standard gun is 25 per cent heavier, or 300 pounds as against 400 pounds, the mussle energy, which is 31,000 foot-tons in the standard gun, is 201,500 foot-tons

and not to the control of the contro

miles, and here it still has a remaining valcerty of 2,500 test per accord. Then, as a commences to fall, gravity egins to act in its favor and probably more than counter-acts the resistance of the tenuous atmosphere, with see again until it gets within ten or twelve miles of the earth, when retarda-tion again takes place, the dual arriving velocity being 2,750 feet per second and the angle of fall being 59 lagrees, which is four degrees

The elapsed time of flight would be 4 mins 9 seconds Since the total length of he gun would be 225 feet, it would have to be built in, parts screwed together This is perfectly feasible in fact,

makers have used the method in some of their guns with complete success. The weight of the piece would be 325 tons and this, coupled with the energy of a recoil corresponding to a muscle energy of the shell of over 200,000 foot-tons, would call for some very original and clever engineering construction in the mounting of the gun Because of its great length and weight it would gun Decknise in the great or engight and weight it would be impossible to mount the pace on trunnons located at its center of gravity, for the gun, being elastic, would bend under its own weight and, when fired it would have a volent whipping action. So it would have to

nave a violent winping section so it would have be carried on a trues, or rather, on the apex of a triangle consisting of three trueses—two side trueses and one connecting the bottom chords of the side trueses Elevation and depression of the gun would be accom-plished by forming the bottom chord of the trusses towards the breach of the gun mto two broad curved and toothed bearing surfaces, by means of which the gun and its carriage would roll upon a sutable founda-tion path in such the same manner as a basoule bridge. The gun truss with its into two broad curved and toothed bearing bascule bridge. The gun truss with its counterweighting would probably be found to weigh at least twice as much as the gun or, any, 650 tons so that a very massive mount and powerful means of checking the recool would be necessary. The gun carriage platform would have to be mounted upon several parallel tracks to listitute the weight, and in addition to adding friction through blocking inter-owed between the under-side of the arriage and the rails, additional retarda-ion could be provided by means of sicel ables, anchored to the forward face of

he gun pit, and leading back to winches ne gun pir, and leading back to winders in the gun platform, controlled by powerful friction orakes. The elevation and depression of the gun might be controlled by a telescoping hydraulic plunger, as

ndicated in our drawing

The thanks of the SCIENTIFIC AMERICAN are due to the Army Ordnance Department for the opportunity to present this very interesting theoretical study of the possibilities of long-range artillery. The results most dramatically prove the futility of building such ordinance The results most A single gun, as pointed out to us by the ordnance officer at Washington, who made the calculations for officer omer at Washington, who made the calculations for this gun, would cost probably about \$2,500,000. The best it could do would be to land a 400-pound thell, containing about 60 pounds of high explosive on a target 1218 miles away,

whereas a bombing plane, costing about \$36,000 would iand a 1,800-pound bomb on the same point with greater securacy of sim.

# Operating Room That lies to the Battlefield By F. Honoré

HERE is nothing new m winged ambidances, which

Airplane view showing flight of 10-inch shell from Aberdeen to Perth Amboy

loss of time But there is distil a novelty in the winged rating room or surgical was I which flies to the battle field and performs its work wit re its patents have fallen
Especially in cases of severely wanted soldiers where operations must be imme but is performed if a life is to be saved as the surger if a plane indespensable.

It has remained for a Freu i d et r Vilmant and a

Russian sugmest, Nemisovsky to introduce the surgical russian digineer, Neminovak to introduce the digital aurplana or winged operating r in whi is fine to the battlefield where severely will illimit ar in need of surgical aid, with its staff of any main resistants and complete equipment. The wiget operating room or

At present M Nemisovsky is engaged in constructing a still larger surgical air plane which is destined to serve as an operating room on the battlefield as well as a means for transporting the wounded This machine will carry seven or eight surgeons

and assistants with their equipment who will be installed at some convenient point on the battlefield. The sirplane will then be avail able for transporting the less scriously wounded soldiers to the base hespital

# Some Applications of Electroplating

ELICTROPLATING is an art which has been developed during the last 50 years with only occasional applications of scientific principles. Formerly the such application of stratch principles Formerly the industry was much shrouded in inystery each plater guarding jeak usly the formulas and in theils employed by him Of 1 cut years however there has been insidered k d mand from electroplaters

and manufacturers for more exact data relating to this industry

This need and demand for information has I cen emphasized during the war by the numerous problems that have arisen in connection with the plating of military supplies of the most varied description Il us zure plating has furnished an excel lent and in many cases the best protection as airplane and scaplane littings, fuse agunst the corresion of swel parts such parts hardware on ammunition boxes etc. Black nickel plating was very ex tensively used for producing the so-called government bronze finish upon braze pardware and saddlery equipment Lead plating proved valuable in the hining of gas shells and for bringing up to standard weight shells which were underweight. In connection with these problems a number of investigations were conducted at the Bureau of Standards whose experts made frequent visits to munitions plants to ad

the desired results Appropriations have been requested by the Depart ment of ( ommerce to permit more exhaustive study by the Bureau of Standards of plating problems and their application to various manufacturing industries Lieotroplating forms an excellent illustration of a 'key industry , t e, an industry which while it is not itself of great magnitude, is often of fundamental importance to larger industries. Thus electroplating is essential to the manufacture of tools huilders and saddlery hard ware plumbers supplies gas and electrical appliances automobiles silverware jewelry stoves household utensils mechanical devices su has phonographs cash

registers sowing machines adding machines typewriter cameras and other optical and scientific instruments and in fact almost every industry in which finished industry in which finished metal articles of any description are produced in the art of electroplating will bring about corre ing improvements in all such industries

Arrangements have been made by the Bureau of Standards to secure, by in quiries addressed to the platers of this country reliable information regarding kinds and methods of plating now in commircial use

# England's Aircraft Industry

A Glimpse of Hei Tremendous Achievement from Small Beginnings

By (. II Claudy Special Correspondent of the SCIENTIFIC AMERICAN, Now in London

WILLS the war studed Great Britain 8 at O on W places to Irin None kn with a what an plan s were to be in the war still less that if y were to be the deciling fate. At the section franction decided about 140 machines with our lattle year impanied. a much luger ain vithor () of Britin vitest 150 000 expelite mary by
When the Unite Pstates are into the wealwepromise t

rather to crashly training sent 20,000 planes perhaps may in but certainly within two your

may a but certainly within two y or. We diluted to C. et Brita, in all a promises but what she lid though up are it. It the known is far more than we promise It. I.
At the beginning Irll was Creat Britain s, separaty for

minufacturing anglin's was not greater than 100 per year. At it tene it accustice was signed she was turning air planes at the rate of 800 a week! In other words har production possibilities were demonstrated to words by perfection posseturities were demonstrated to be near see of 40,000 planes a year! Illink of that and remember that it is not America with his limitless resources for a rul money and factory and ruc material but the British lakes with their very much matter and the state of the sta get the actual facts take off year leat and low in deep respect to a nation we of America are rather too apt to consider slow and old fashioned in methods when it

Course to factory production

Nor that for a mannet. Oh well after all they were only British planes and enguies. The only doesn't ability minerarchity steadness and stirringes the British planes led those even of I rance home of aviation As for Cormany's much vaunted planes while it is freely admitted that it was Cormany which first armed a plane with a rapid fire gun shooting through the propeller a more which gave the Allies scrious trouble in 1915 her craft as craft were never in the same class with the British lighters only history and the perspective of years will tell how much of the war was went in the but all the facts of both quantity production and ability to stand up under gruelling work are on the sid of the British machine

It is dilbeult to give an idea of the seze of the industry as it is ligures mean so little to the average reader and et hguns and only hguns can tell the story adequately In 1914 there were six factories in Fugland turning out There were 126 firms under contract for planes besides three huge royal arrests factories at work here when the armstee was signed. And they produced

In the year 1918 and please recall that the armistice was signed on the 11th of November I ngland turned out no less than 40 849 airplanes of all types. And they were all cagned not it is true all by home manu-facture but they were all engined—indeed the available engines exceeded the planes there having been 31 021 engines available from all sources!

Lest some one with a vivid (magination and an intense patriotism imagine that the Liberty motor played any ery important part in this engineng campaign let it b stated that liberty motor deliverees to lingland a mmenced in May that the promises ran from 20 in May to 100 in lunc 200 in July 400 in August 500 in September 315 in October and 316 in November while deliveres commenced with 14 in May and then rue 50 125 336 92 130 and a final delivery of 132 in December In other words we promised 1851 by November and delivered 1255 by December

universal 1250 by December.

And this was one engine in very fine engine an engine
given the highest graine in I ngland both for its perform
ance and for the inserved of its having been designed and
put into production so soon and so rapidly. But if England cuted to she could in the considerable fass about er owe ability to produce engines! It must never be forgotten that I ngland did not recognize any more than did the rest of the world that the war was to be largely won in the ner until the war was well along into its four years of life. By the time she was ready to realize that there must be planes and planes and still more planes. years of his and that planes meant engines and that engines first of all steel, the manitions industry had stepped in and grabbed most of the available steel and had it all promised for other things Yet at this point Great Britain developed a new steel industry to feed her engine factories, and was neaking more than she needed when the armistice ended the necessity

The total number of airplane eigines delivered by Bultish contractors during 1918 was 21,950 Libra number includes 23 different varieties made in quanti-ties ranging from eight to 4,064. It is not necessary to ocation than all but it is interesting to see them divided into classes. Of two typs of vertical engines 5370 were made. Of the V-typ in doss there were 12 makes produced to the tune of 0.011. Iwo makes of radial ugues—sumilar in appear in t rotaries but with the cylinders stationary—were mil in quantities ag-

greating 16 Finally there were 56 greating 16 greating 16 Finally there were 56 greating to follow the nation of rotary engine 11 is interesting to follow the nation of reagances in the light of history 1 lanuary the total production of all makes was 1661 1 chruary awn 1428 manufactured and March 1741 16 March was the great German offensive, it will be r membered and of course all production was speeded | But it takes time to speed up production of engines | 50 April saw 1 667, May 2 039 June 1 760 and July 1 881 In August they drew hreath and turned out only 1 -8 but by September and October production was gork on like lightning 2 387 and 2 845 engines coming feeth ready to fight the Bun Thou cam November at I the armistics and production dropped to 1,615, follow his December with

The production of planes of mrse exceeded the production of engines Particulus is due to the sensiting of planes which does not always smash the engine and partly to the feet that it is easier to make a plane than an engine battleplanes per haps excepted. But there were always enough engines when the foreign sources were added in with the local

It must not be forgotten that there are two sides to the air Science and that the naval scie was of very great importance. Thus there were made during 1918 in addition to the 30 000 odd aircraft already mentioned no less than 1 407 seaplanes, which number includes flying boats. Not until the British Admiralty chooses to unlock its lips will the story of Britain's navy in the air be known but it is a strange story judging from the straws which stick out here and there one worth telling and

worth hearing

A little sidelight on aviation in general is thrown by he propeller statistics England produced in 1918 no less than 80,446 propellers, which is very starly three propellers for each plane! This hight by the way, is for 11 months only. December statistics not being available Evidentity the mortality among propellers is no less on this side of the Atlantic than in the United States. The largest month was October with 11 123 propellersnearly 400 daily

Some factory statistics may make the picture a little clearer. In one shop, for instance where Handley Page machines are made—the great big machines which carry so much weight, either in passing ris or in homis— there is employed an average of 1 000 people of whom there is employed an average of 1 one proper or woom 400 are women During Mav line July August, September and October of this year this particular factory put out 25, 23, 23 27 21 and 18 machines. It required 16 770 man-hours per or white in this shop, plus about 50 per cent to be add on account of work done on sub-contracts, to complete one of these huge

The smaller machines of course did not take nearly so long to complete A shop devot d to the manufacture of the familiar Sopwith Camel turned out 60 40, 34, 36 35 and 47 machines during the moi the mentioned There are employed here an average of 650 people, of whom are employed here an average of 1991 people, of whom from a third to a half are women. The man-hours re-quired for one of these machines is but 435, which is surely rishing it through—43 ten hour days for one man to make a planel

to make, a plane!

It may be micrestum; to note the size of such a factory. This particular Camel factory has devoted to mill work. SI 48 equars feet to jointers shop 2,7,21 equars feet to dope and fahres shops 9,048 equars feet and to the man erecture, shop 1,448 equars feet of space. In a contract factory devoted to making D II mues, there were turned out finished planes at the rate of 147, 145, 173, 49, 88 and 195 in the mouths from May to 0 to their inclinave. Here there were in the neighborhood of 2,000 men and half that number of women employed. The man-hours per maxime were 4536, to which some 15 per cent must be added for the contract work done in other shops to complete the plane. The size of this factory is shown in the floor space used, 9,450 square feet in the sawing

shop 57 000 square feet in the joinery shop and 150,000 square feet in the main erecting shops

Altogether Great Britain manufactured more than 50,000 planes in 1916, 1917 and 1918 Had the war continued much longer, she might have rivaled our own Liberty in engine production as the big Napier Lion was just coming into production. It is a 12-cylinder, was just coming into production. It is a 12-symmer, 2150-revolution-per minute engine with ideavolps about 480 horse-power. In this connection it is interesting at 50 more than it is not note the universal experience here as between the production engine and the hand-made engine. There is no question but that the production engine can be made so that the total output vasily outdoes the life of the total content of the hand-made engine with this same grant-hours content of the hand-made engine with this same grant-hours. output of the hand-made engine with the same man-hours per engine But there is also no doubt that engine for per engine. But there is also no doubt that engine for engine the best production engine is inferior to the hand-made engine in lasting qualities, in an average ratio stated with diffidence by many who should know the exact figures, to be two to three life; is, if the life I hat is, if the life of the hand-made engine is 120 air-hours that of the pro-duction engine will be but 80 hours by much for the

theroughness and care of British machinists labor!
But when all is said and done there is no real exaltation in figures and no enthusiasm in statistics. Grant that more machines came from loss floor space and less man-hours here than anywhere else-which may or may not be the case - and what is there in the statement after all? The big picture is in the fact that with 66 planes going to France with the first expeditionary force, with a yearly capacity of 100 machines and those by no means recapacity of 100 machines and those by no means re-markable for speed power, endurance or dimbing ability Grest Britan has within three years, put her amplane midsarty in the front rank of those of the world, supplied herself and her allies, and our own troops very largely with planes produced, and precured engines enough to pull through the air the stupendous production of war, then 1000 chalms are seen to the stage of the second o of more than 10 000 plants yearly, and was going at the rate of over 40 000 planes yearly when the armistics

What six will do with her sirplane capacity only the What six will do with her arphane capacity only the future can show But for the present, both in planes existing—in figure which unfortunately cannot be had—and in plane-production power, Great Britain is as much mistress of the arr as she is mistress of the seas. And she did it all in less than three years

# Ships of "Puffed Brick"

THE world was skeptical when engineers announced as a win-th war measure that they would build sea-going concret ships. Who ever heard of a rock floating anyway? The same sort of talk confronted the man who made the locomotive. He was told the wheels would simply spin and that there would be no traction But the locomotive walked away with itself and its load.

But the locomotive walked away with itself and its load, just as the concerte ship floated as gracefully as a swan. But when the engineers tell us they are building a ship of puffed hork. 'they are arraying things, it would seem, to a foolish extreme.' Yet this is what manne engineers are doing out on the Pacific coast. Two puffed-brick ships are soon to be launched at San I ransesce. Brids layers are not however, employed in building this layers are not however, employed in building this layers are not however, employed in building peculiar type of boat, because with the mortar un

trowel-wielding laborer is not required

The puffed brick used is made, like ordinary brick, The putted brick' used is made, like ordinary brick, of a peculiar day containing a low percentage of silica Subjected to an intense heat, the brick puffs up like oppororn. The product looks something similar to coke and is about as light. Once pushed the bricks are ground to a dust and mixed with comment. This process, it is claumed, makes for a gun of about 40 per cent in the lightness of the ship's walls, without losing any of its highly walls, without losing any of its

strength

The ship's forms are built in standardized sections and are hinged with bolts so they can be forced up and put out of the way when the concrete hardens After launching, the forms are quickly put back into place, sited reinforcing rods installed, and the pouring of another ship can be begun

According to experts in concrete shipbuilding this system makes it possible to turn out a 7,500 ton-vessel every three months, and only about 25 per cent of the lumber in the forms is wasted The first two ships built of this material at San Francisco, coach 7,500-ton off tanks, are ready to be launched They resemble steal ships in their lines and are a big improvement over the tants, are reasy to be saunched. They resemble steet ships in their lines and are a big improvement over the "Fauth," the first concrete ship built. They are to be launched broadade to the water, as this method spreads the strain over a larger surface.

# The Chemical Foundation

# A Semi-Official Corporation that Will Hold the Fort Against German Reinvasion of Our Chemical Industries

WHEN the Ahen Property Custodian began taking this country, he found himself confronted by a curious situation. The Trading with the Enemy Act had not in the first place been so drawn as to make it possible for the Custodian to take over enemy owned patents and if he were to attempt the operation or the sale for operation of the sersed plants, he would be laying the founds tions for much future litigation and possible heavy damages to the owners of such patents. For in the eyes of the law one who uses a patent without the consent of the owner is an infringer, whatever the circum patents are not granted with the reservation that they become invalid in the event of the war

An amendment of November 4th to the Trading with An amendment of November 4th to the 'Irading with the Enemy Act was designed to remedy this defect in the original law Under its terms patents were in-cluded among the enemy property which might be sensed and held by the Custodian, and it at once became possible for him to operate patents himself and to liceuse ir operation by others, either exclusively or otherwise But on careful consideration of the matter. Mr Palmer. olding the office of Alien Property Custodian, decided that there was far more promise even than this

m the new situation

It seemed, in fact, that the suized patents might afford possible solution for the problem, theretofore unsolvable, of protesting the now American dye industry against German competition after the war. It was evident from the manner in which the German chemical concerns had done their business that they had no intention of manufacturing in this country and did not fear competition from American manufacturers, and that accordingly they could not have taken out American patents with any idea of preventing American competithese patents as protection against competition in the American market by other Furopean manufacturers If they were sufficient to stop importation of competing Swiss Trench and English dyes they would presumably swiss I relate an Languist very city would presumanly serve in American hatds to stop equally the importa-tion of German dyes. This was particularly probable in the case of the product patents since most of the coal tar dyestuffs are definite them at combinations to which a product patent is entirely applicable

The idea was accordingly conceived that if the Garman chemical patents could be placed in the hands of any American institution strong circugh to protect them a real obstacle might be opp sed to German importations after the war, and at the same time the American in dustry might be freed from the probabilition enforced by the patents against manufacture. So a corporation has been organized to be known as Chemical Loundation Ine in which practically every American manufacturer will be a stockholder, but in which the number of voting shares held by any one interest will be so restricted that improper control will be impossible. This I ound then will hold the German chemical patents some 4 500 in number which have already been transforred to it for a consideration of \$250,000. It will in no case operate any patent itself, it will narrly set as a holding and heening body Nonexchance houses only will be granted to all proper American applicants at a small fee, and to the United States without fee. All surplus income is to be used for the retirement of the preferred come is to be used for the rectinent of the preferred (non-voting) stock, and therefore for research work looking toward the advancement of chemical and allied science and industry. In this work the I condition will have the cooperation, and ab veall the use of the equipment of the Bureau of Standards and various other public and private research or mizations. The capitalization of the 1 modation is half a million

dollars of which \$100,000 is v ting common stock and the balance preferred stock. After paying for the patents transferred to it by the Alien Pricerty Custodian it will have \$250,000 working capital and it will accordingly be in a position to prosecute vig irously any infringement proceedings which may become in order when German manufacturers begin their attempts to regun their American market

The price paid for the patents which constitute the stock in trade of the new oncern was necessarily some what arbitray. The girlt majority of the patents presumably are valueless. Of the remainder the value was quite impossible to estimate. Substantially the entire American dye and medical dar lustrics having combined in the procurement of the spit of fit this under-taking it would have been impossible in public sale, to find as a bidder any legitimate manufacturer bid received would necessarily have been from speculators with intentions amounting to blackmail or actually acting in the interests of the former owners. So the sale of the patents was made privately and at the figure mentioned which represents merely somebody's guess as to what the patents are worth but which no matter hew wrong it may turn out to have been can injure no one but will serve as a basis from which the Loundation can begin operations

In a comprehensive report covering the matter of Ger-ian chemical patents. Mr Palmer the outgoing Alien Property Custodian explains very fully the manner in which Germany had secured her world monopoly in the chemical field the accessity for breaking that monopoly, and the official expectations that this I oundation will constitute a very potent means toward that end. In a later issue we shall present some of this interesting material to our readers for the present we have space been put into operation. The new institution promises an incalculable benefit not only to the dye and chemical industries, but to the whole American manufacturing world The opportunities which it can offer and the rewards which it can hold out to competent research scientists should far exceed those of any institution uncouncited with industry and it may well therefore, form the nucleus of the greatest research organisati in this country

# A New Plan for Daylight Saving

To the Editor of the SCIENTIFIC AMERICAN

The plan of setting the clock back one litter in order to save the daylight of summer takes advantage of part of the wasted daylight, but does not begun to be efficient in this respect. The sudden change of one hour in time a laways attended with confusion and discomfort. The following plan will utilize all of wasted daylight and will avoid confusion consequent on a sudden arbitrary change of one hour in the time

The difference in time between sunrise on the 22d of December and sunrise on the 22d of June is approx mately three hours or about thirty seconds a day beginning of the working day is now fixed with regard to the middle of the day In order to use the daylight hours effectively the time of sunrise should be the beginning of enectively the time of sunrise should be the fix mining of the day instead of the greatest mirridian height. Here fore a plan by which the beginning of the working day is changed automatically with the change of sunrise will afford the greatest efficiency in saving daylight. This can be accomplished in a very simple manner

The Western Union, through its electric clocks gives official time throughout the country. This official time could be easily changed during six months of the year by regulating these clocks to make them lose two seconds or more each hour or sixty seconds a day. The watches and clocks of the country can easily be adjusted to run thirty fast during the other six months Light o'clock seconds fast during the other six months. Eaght o clock is probably the most popular time the country over for beginning the day's work. The ideal surrise time would probably be seven colock, since when the sur rises at seven there is usually sufficient light for ordinary pursues. poses by 6 30 which would perhaps be early enough for the rising time of most of the people. This plan would, therefore, best be put in operation at the time when the sunrise is at seven o'dook which would be about the first of February. The people would then continue to rise with the coming of the light the year 'round and it would be done automatically. Having once adjusted time-

es people would not realize on the 22d of June that pieces people would not realize on the 220 or raine they were rising three hours carrier than they were accustomed to rise the year he for

On the 22d of June the time pieces would be reversed and the master clocks would gam 30 seconds a day for six months and without knowing it people would by the next February be rising three hours later

HALSPY W WILSON New York City

# A Camera for Filming Rapidly-Moving Objects

THE conventional motion picture camera is excellent enough for the regular run of tilin work focused by estimating the distant and then setting the lens according to a scale of for more accurate worl lens according to a scale of from accurate work the mage, can be focused by bold methods a perholos and on to the film, which acts in the same mainer as the ground gloss of the plate contra. And when it is necessary to follow a moving object the camera can be travered and tilted by means of two handles actuating the tripod head

However, the conventional camera has its limitations particularly in unusual film work such as may be en countered in screen reporting and trivel subjects fact while doing extensive s leath work in the jungles of Africa, Carl D. Akely of the staff of the New York Musium of Natural History from the insual type of motion-picture camera in id first and mischable for the varied uses of field work. Knowing the demand of the topical and scenic cuntrium he conceived to principle of the present cinera which bears his nan-Upon his return to the United States he designed in 1 executed the first working model which was deser > 1

an these columns almost three verus age.

And when the Signal Corps of the United States At my embarked on the gigantic task of filming out part in the war, the authorities settled their choice on the Akeley camera because it met their requirements better than any existing camera. The fact is that the Akeley camera any existing camera why it is available for special work which can hardly be undertaken with the average camera

Briefly, the Akeley camera is a one-man camera, in the sonse that its operator can carry the camera magazines some that its operator can carry the camera magazines and tripod himself, and set then up without assistance. The Akeley tripod is of the true design, with the members locking by means of cerentric clamps. The legs are placed in any convenient position, and pulled out to

any length desired whereupon they are immediately locked in position by pulling up the contrict claims.

The camera is thin lockled by means of the ball-andsocket joint and a spirit level. All in all, this tripod
mounting is absolutely rigid.

The tripod head in this instance does not call for the usual cranks for the panoramic and tilting movements. Instead the camera is controlled by a short lever which protraids at a 45 dayer upward angle from the rear of the case. By applying pressure on this lever the amera, can be moved betweenfully or vertically or both hom-zontally, and vertically at the same time. A steady movement to nesured by gents and flywheld and a re-heaming device permits the teamer to be questly moved of following an exceptionally fast object. The horizontal protrudes at a 45 degree upward angle from the roar of is a might write permits the camera to be quickly moved if following an exceptionally fast object. I he bornsontal panniamic inoverment permits of a complete circle while the virtues that allows of a 140-degice range pointing from the ground to directly overhead without changing that the range is made in the factor in the tipod. while still retaining the tripod lead and three point support for use on a table log rock or other surface.

I will leases are employed on the Akeley camera one

for the film and the other for the finder. This arrange-ment permits of watching the picture on the ground glass right side up while operating the camera. Again, eyepicce always remains in the desired position no matter how the camera may be tilted because of a double prism system of transmitting the image through the hinged tube. Thus the operator can always tell whether his meture is in tucus-indeed he sees exactly what the is recording at all times

The shatter of this comercias in the form of a continnous fabric helt containing a variable opening. This belt travels between the double walls of the camera case Its opening can be a limited for any size so as to vary the length of exposure in fact it is a focal plane shotter quite similar to those employed with reflectingtype cameras. The movement is also unique being of type cameras the movement is also inique occas or the single pin design. The magazines are made in one unit and are always ready with a short loop for insertion in the camera mechanism. This permits the camera to be reloaded and threaded in from 10 to 20

esimira to be revolucial shall intradice in from 10 to 20 seconds. Complete the camera weight 45 pounds. For filming rapidly moving objects, such as motor boats, nightness athlets, and so on, there can be no doubt that the Akeley camera is in a field by itself. And this is but logical since it was designed primarily for that purpose by a man in need of such equipment.

# Return of the 17-Year Locust

# What He Is and How to Combat His Ravages

By W. H. Ballou, Sc.D.

THE Department of Agriculture Washington warms A that this will be one of the worst scisons on record for manges by the Seventren Year locust. Government entomologists predict that the variety is due to swarm in large numbers

Somehow the idea is brouleast that the country is osited by this variety of locists only on c in 17 years this version has no application. The marct derives its common name merely because of the fact that it requires a full fledged boast 17 years to proture from the requires a run nough from the registrough the several stage. It is quite possible for the variety to be lusy an ewhere every ven. I note the following label at the month of plan of the insect at the American Mus num of Natural History. New

The 17 Year Cicida III is a september appears in the late May or early June of a locust year immature creates criwl at and second tree trunks of other vertical surfaces. If the granned is dry or bare they make a circular opening only if moist or covered with leaves a mud tower is built around the hole from which they emerged. These towers are frequently made by the immature creades several weeks before they are ready to knye the ground Within a few hours after reaching a suitable resting place the skin splits along the middle of the back and the adult emerges. Later,

recompense them for the long period of preparation. There are a score or more of different broods, each of which has a rather definite—often restricted—distribution and time of emergence from the ground. Suppose there are three such broads in your neighborhood. One of them the adults, may have apprived in 1911, its next appearance would be in 1928. Inorther might be 1916-1943, and so on, while a third might be 1916-1943. As a matter of fact, these are actual broad dates, although they may not be the ones in via meighborhood. Hence we may have 17-year locusts oftener than every 17 years, to say nothing of the possibility of lagards or extra spry individuals, in the various broads, which do not appear on achedule time of the property of this family I might be noted that the man Cu i to these of many rc are three such broods in your neighborhood

It might be noted that the name Cu i la tibuen of many books as applied to one of our harvest fine is an error prohably being a tropical species—the differentiation of species is largely based on the form of the male genital plates, although there are size and color differences—An attentive car can detect differences in song Of the genus Canda as now limited, the small spenes, hisroglyphica, with an almost transparent abdomen, may be found in pine barrens, and is our only species says, fairly typical of its genus, is the common one of our region. The somewhat similar Okinagana is more region in the Somewhat maintar thinagana is more common in the West than the Last in addition, it may be stated that the 17-year locust has been removed by Luts from the genus Closda and placed in the genus libicana, where it belongs by right of priority He

The Croadae are known as creadas, harvest fibs and locusts The eggs are laid on twigs The newly

The protective pyramids of earth made by the locusts

the female deposits her eggs in a succession of slits in the terminal twigs and slender branches of many kinds of trees and shrubs. About 15 eggs are placed in each slit The branches thus punctured frequently break off and The well known song is produced by the male In the late season the insects are attacked by the lower fungus Masospora cicadina developing in the abdoin It causes the posterior abdominal ribs of the insect to

Locusts emerging from the 16-year solourn in the ground

The following up to-date statement on this destructive insect is noted in Field Book of Insects just off the press by Dr Frauk F Jutz, Associate Curator of En-tomology of the American Museum

'The 17 year Locust, as a matter of fact is a 13-year locust in the South. The adult is of the same general shape as its relatives, except that its eyes and the prin cipal veins of its wings are red. There is nothing mystical in this color or in the W on its wings although the sudden appearance of the adults in large numbers has been supposed to forctell was. For about 16 years in the North the young as k at the roots of plants. Foward the end of this period scale-like rudiments of wings ap pear In the spring of the 17th year the nymph makes its way to the surface of the ground I v a smooth firm From late May to carly July it and other members of its brood crawl out singly or in droves t support, the adults having a week or so of serial life to

hatched young drops to the ground and burrowing into hatched young drops to the ground and burrowing into it, feed by sucking the judes of roots. It lives in this way for some time, the length depending on the species at appearance changing but slight!) Finally, it dig out by means of its enlarged front fert crawls on a tre-trunk or some such thing, splits down the back and ilterates the adult. The adult male sings often very loudly and shrilly by obstacting me infrances stretched nodly and shrilly by obstacting me infrances stretched node, me the base of the abdomen. Interesting as the carrier of a louist may be it is as

Interesting as the career of a locust may be, it is as nothing to the tragedy in nature of its extermination, after it has had the termenty to leave Mother Farth, dry in the sun and deposit its eggs. This extermination is brought about in the adults by a lower fungus which commences to breed in its body during hot weather This fungus belongs to one of the irost peculiar groups This fungus belongs to one of the not peculiar groups called Entomorphilorarens, because they are minute parasites which inhabit bodies of small fires and other insects. They are distinguished by the production of numer rous hyphae, or tubes which reclose essential protoplasm. The hyphae of insect-destroying fungi are of large diameter and fatty contents, ultimately emerging from the host in white masses of peculiar appearance I hey produce at their extremities large conidial or sexless sports which are violently discharged into the air and propagate the disease. In addition to these conidia, and propagate use unsease. In a mountain to unsease communi-ties propagation of the fungus, after long periods of rest, may be provided for by the formation of their walled creting spores, adapted to withstand auccessfully the most unfavorable conditions. Resting spores also may be either sexual or assextial. In either case they finally germinate and produce conidia in the locust that are discharged in the usual fashion, when they infest fresh hosts. Locusts, fises and other insects greedily eat these spores, thereby becoming infected and later destroyed as the fungus spreads through the body, absorbing all its edible contents for its own use

edible contents for its owns use. The hypothesis of infection of insects by contact with one of the condise, while possible, is altogether insprubble and not within actual recorded observation. Issuets are notorious esters of the spores of fungi. The larvae of insects, isoding on a fungue, likewas absorb the spore is described with the content of the spore in the condition of the content of th the varied elements, air, water, etc., to retain its germin-ating power under nearly all conditions for an indefinite period of time, to lodge on a weak spot of its own type of host, to cling there and breed whenever, later, oxygen of nost, to cling there and breed whenever, later, oxygem and temperature and monsture are agreeable to it. The fungus, however minute, grows larger and larger on the host's food, while the host grows thinner and thinner, until its vital organs are destroyed. The house of the locust or other insect is largely constructed of chitin, which no known fungus can utilise as food, and so it too must demise when its host can no longer provide food

The time to destroy 17-year locusts is while they are

Locusts drying out on a pine tree after emergence

on the bark of trees and shubs, drying out, a period of perhaps 10 days. Use an insecticide then or any other convenient means and kill them. Otherwise, the females as soon as they get strength, will leave the bark and proceed to lay their eggs on leaves and twags, destroying the foliags, later to roam with the males, destroying the foliags, later to roam with the males, destroying out the process, and destroy them by burning or in the roccuss off the trees by hand, however slow and arrive out the process, and destroy them by burning or in the foliage of the strength ment of Agriculture, Washingt

# otrical Control for a Train of Motor Trucks or Other Vehicles

TEX heading of a train of motor trucks or other moving vehicles over ordinary streets, roads, rasks, or water, has been iffied of late by a new control system ed, this control system has wide posdibilities especially in converting our pres-ent excellent highways into real traffic ent exc arberies; for, instead of single trucks and trucks and single trailers, this system makes possible the handling of long trains

makes possible the sandling of long trains of many units, with the same facility as the single truck of the present day The newly-introduced system of elec-trical generation, control, and distribution is the invention of Rodolphus Fuller, a chanical and electrical engineer of Detroit. Mich It is said to differ from all other known systems of electrical control harstofore used on self-propelled vehicles In the general application the system of Mr Fuller uses four series-wound motor

for vehicle work, each motor driving an individual wheel The series field windings of the generator—for this system is a gasoline-electric one in the case of a motor truck so agrouns-encertro one in the ease of a motor truck— are multiple compound, and the electrical controller in conjunction with the electrical generator is the main feature of the entire system. This controller will operate any number of motors in sories, in series parallel, and in perallel in This arrangement gives quick acceleration with high power to overcome initial torque. Any aumber of motors from a single motor to any multiple of motors may be operated for any purpose whatsoever with this system

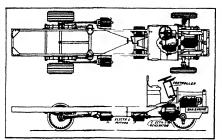

The control system does away with the use of all resultance in the main line circuit from the source of generation to the motors per-forming the work. The system does not use resultance devices to prevent too great a real of current to the motors when starting a vehicle from rest to acceleration The electric generator always delivers a gradually increasing voltage from rest to full acceleration, instead of starting with full votage in the circuit. In other words the voltage is generated from zero volts to full electromotive force, which keeps the generator electromotive force higher than the counter-electromotive force of the electric motors operating the vehicle

By referring to the accompanying wiring diagram, it will be noted that the generator

dagram, it will be noted that the generator series winding are duvided into eight sets of couls. Any number of coils may be used. In the first opention of the controller handle, the current does not pass through the Seld winding. It short circuits across the field winding. The four motors are in circuit with thomselves and the armatures of the generator. A small amount of surrent goes through the shunti field windings, also a small amount through the shunt field windings, also a small amount through the series windings, but not anough proroughly for rase this voitage in the circuit above windings and the series of the series slips off sontact and the current after it leaves the generator armature, passes through the first set of series field cods, resulting in a rise in voltage. A movement of the controller handle to the next notch passes the surrent

through two sets of series field coils, again increasing the voltage The movement of the controller is continued in a similar manner until the eight sets of series field colle are active and the voltage is increased to approximately 25 per cent of the maximum voltage of the generator During this time the shunt field windings have been in-

At this point the shunt field rhaustat becomes opera-tive, increasing the electro-motive force to its maximum motive force to its maximum for the full acceleration of the for the full acceleration of the vehicle. It is obvious from what has already been stated, that Mr Fuller's system of control operates by increasing pr decoming the magnetic field of Mild the control of the

Two views of an electrically-controlled motor truck driven by four motors

generating source. Some of the many practical uses which suggest themselves at present are. Motive power for railways, tractors, trucks for engines and similar apparatus, motor coaches buses (axicalis and sight

eing cars
In the construction of any vehicle for any purpose the control system under discussion embodies a maximum of flexibility and the greatest variety of speeds according of nexulity and an greatest variety of spaced according to Mr Fullers claims. A trailer or a train of trailers may be synchronised to turn in I track with the leading truck or tractor. Each trailir can be provided with motors, and in the case of delix y of freight each may be left at the respective station for unloading while the

Gasoline-electric motor truck equipped with a driving motor for each wheel

train continues with the other musts. What to Know About Radio Activity

317

DOUBTLISS every intelligent person has now a reasonably good general idea of what radio-activity signifies. He understands that aside from the first radio active substance discovered radium there are a number of others and that there is a certain relation between them all knows that several types of radiation or emanation are given if he is aware of the fact that then is a n sort of progressive degeneration from one form of radioactive matter to an other. If he is bette, read on the subject than the average lay If he is better man he understands that the belium atom is suspected of a certain degree of com-plicity in all this business of breaking pherty in an this obstices it or taking down and he appreciates that the whole subject is intimately tred up with the very nature of matter even with its genesis. He may or may not have heard the half period mentioned-if he has perhaps he still looks upon it as a funciful conception of the novelist who with truly remarkable

foreaght or even more remarkable luck int upon this means of representing the rate of decay, and formulated the notions regarding the nature of the decay process which make such a means of timing it in orde

In any event whatever the extent of the lay reader s familiarity with this field be knows that it is the one thing of paramount importance in the chemical and physical science of the day. He would doubtless be of what it all involves if he knew where to look for that notion Accordingly, we have sought to meet this need—which we hope and believe is a real one—by commencing, in this week s issue of the SCIENTIFIC AMERICAN SUPPLE-

MENT No 2256 for March 29th, an ad men't NO 2236 for March 2940, an au mirably executed popular address upon Radium and Radio-Activity, by Charles H Viol Mr Viol is director of the radium earch laboratory of one of our enthusiastic corporations in the matter of industrial research, and is indeed an authority upon the subject. His address will run through three issues of the Surri E-MENT it will be found comparatively casy reading and sets its subject out in a most illuminating and interesting manner

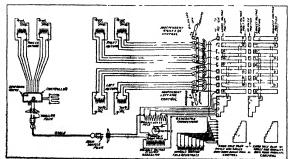

# Oil Fields in Alsace-I orraine

Wheel

A in lice or coal and potash, but also
considerable resource for France At a resource for France At a recent date,
the Commissioner General of the Oil 
the Commissioner reneral of the Off Commissee Senator Heary Rerenger accompanied by the members of the Interallied Conference, who were a tive in affording him all possible cooperation with a view of determining the distribution of supplies to the Allies and the early population made an inspection trip to the oil fields and the extensive plants already creeked and which the Germans had been operating. The center of the industry is at Pechelbroan to the northeast of 'trasbourg. Although the oil fields were known as far back as the 15th century, industrial working did not commence until the 17th century. Speaking of Procent dates in 1889 the annual

production was still small being only 6 000 tons of crude oil but in 1900 under a Prus-

sian company the production rose to 30 000 tons During the war a very active explortation caused the amount to reach 50 000 tons. The prod. ucts obtained from the Alsa tian crude oil consist capecially of fatty oils such as are useful as lubricating oils or 65 per cent of the total while the amount of kerosene and gasoline is smaller than for many other crude oils. It is considered that the 40 000 tons of lubricating oil supplied by the Pechelbr fields represents no less than 50 per cent of the total French consumption As re gards gasoline, only 2 per cent of the national con sumption can be thus sup-plied, and for kerosene still The Oil Committee is now engaged upon active measures for operating the oil fields

# United States Chemical Warfare Service—I

# Building a Poison-Gas Plant With a Capacity of 200 Tons Per Day

THI unroduction of poson gas by the Germans was a military as well as a moral blunder—a moral blunder because its use was expressly forbulden by the Hague Conwintion a military blunder because when the Germans decided to introduce the form of attack they made the missists of not well attack though the whole line. It was well for the Allied cause that they whole line. It was well for the Allied cause that they whole line. It was well for the Allied cause that they impationer was committed when they introduced the impationer was committed when they introduced the submarine attack inpen mer chaintine. I he mention of waging such warfart long autodated its introduction and the Commission of waging such warfart long autodated its introduction of waging such warfart long autodated its introduction of waging such warfart long autodated its introduction of of our or five bundred, and then launched their attack, the result would have been fastal to the Allied cause.

However terrible although the first attack with gas proved to be it was limited in area the Allies came back with the gas mask and the Germans chance of a decision shipped by The Allies in self defense made use of gas themselves and ultimitely surgessed Germany in the style of warfar. More than that with the entry of the United States into the war we developed our gas-making facilities at such a rapper rate that at the dose poseon gas per day and if it had not been for the armstere, we would could have sent by I say 1st to the waterin front over 200 tons of gas per day to be sprayed in shells over the whole German front. What the would have meant will be understood when it is stated that the total output of the German front. What the would have meant will be understood when it is stated that the total output of the German factories was only 30 tons of gas per day Furthermore we have learned since the armstice that the greatest amount of that most deady product mustard gas that the Commiss could manufacture was a manufactured to the control of the control of the country of 28 tons of mustard gas and by Innuary 1st would have been in a position to ship overseas 100 tons of mustard gas daily.

# When We Entered the War

At the time of our entrance into the war we had very little knowledge as to what materials were employed by the enemy and how the stuff was made. But in November 1917 the Government deceded to build a small shell filling plant on Gunpowder Neck Maryland which formed a portion of the Aberde: Proving Ground received and it was at first inter all of have the gas produced by chemical manufactur rs and shupped to Gunpowder Neck for leading stock helds In December 1917 the Government had diled that a bottler plan would be to build it sow the all plant and manufacture the toxic materials staelf. At that time the property taken over at the Gunpow ler Receivation was largely cultivated farm land and there was no provision for bouring men or for brunging materials to the site

A fromen cube of mustard gas

Bunk houses were at one built and railway spurs were laid from the Pennyivanan Railwad Construction was started in apite of the extremely severe winter of 1917-918 A water supply of 24 oloy gallons pr. minute for manufacturing was brought in from the Bush River The shipping facilities via the I cinsur/vana Railwad were supplemented by dredging a thansil from the reservation to Chesspake Bay to admir of shipment by water

# The Government Erects Its Own Plant

Because of the urgency of the demand it was decided to sall at one upon the chemical manifacturers of the country to assist both in investigation of processes and in the production of gas — The man facture of chlorpierin was begun by a firm at Stanford, Conn., and of phosgene by a firm at Nagara Falla I was during the winter, as a result of the growing importance of gas warfars and of the representations of French and British officers who came to the United States, that the Government determined to creet a very large dulorine plant of its own, and in January 1918 Cell Walker who has been so long and favorably known to our readers as Prof Walker of the Massachuscits Institute of Technology, was made commanding officer of the Cupporder Reservation, which is now known as Fdgewood Arsenal In July, 1918, Edgewood Arsenal am and a part of the Chamical Warfare Service under the direction of Maj. Gen. William I. Sibert.

The Ldgewood Arsenal comprises the following seven

departments
lirst, an executive office which was moved from
Washington to Baltimore and was located in McCoy
Hall one of the old Johns Hopkins Turversity buildings
second the construction maintenance, and stores
devision that the headquarter military organisation
fourth a military medical hospital, and then the great
gas manufacturing plant proper, including, fifth a
chlorine plant for the manufacture of caustic soda and
facture of toxic materials and seventh, a plant for filling
liquid chloring sixth a chemical plant for the manufacture of toxic materials and seventh, a plant for filling
the shells Livens projector drums, Stokes mortar bombs

hand greaades etc.

Apart from the construction of the plant itself, a large
amount of important engineering work and other constructional work had to be done in bousing and taking
care of the civilian labor which was employed in putting
up the buildings etc. and in housing the operators, who
numbered 5 500 and who were all enlated mon. The
portation formed a military organization and regular
barracks were built for them, and they were subjected
to the same offill and discipline as are found in an army
prawnt in a posson-gas sublishment; it which

### Rapid Construction of the Plant

There was a hurry call for the construction of the gas plant, and the response made both by the sugmeering and channels experies, who came out of crul filled to assist the Government in this emergency, and by the consistence and absorber forces, forms one of the most creditable chapters in the shatory of our war schievements on this seed of the Adatare. Although ground was broken in the what of 1917-1918, it was not until abantary, 1918 that until the contract of the contra

three 8-inch pipes for the transfer of the chlorine

from the chlorine plant to the clumical plant.

Permanent barracks buildings, comprising 16 two-story tile-wall structures, each 50 ft by 200 ft, electrically lighted and with every accommodation,

capable of housing 2,050 men

A water-supply system, including a 1300-foot dam, 6 feet high, an electric pumping system, two pipe lines, 10-inch and 12-inch, extending for 0,200 feet to a reservoir at an elevation of 155 feet, of a capacity of 1,600,000 gallons, two pipes, 10-inch and 1-inch, extending from the reservoir 0,000 feet to the reservation, where it is distributed to 11 miles of mans, 16 inches and 14 inches in dismeters.

As showing the rapidity of the work, we may take the case of the construction of the chlorine plant, which consists of two large buildings each 82 ft by 540 ft and 24 ft high Detailed plans were received on April 26th Work was started on the cell building on May 1st and the first of the four sections was ready to receive cells on May 27th, and the last section on June 11th

Again, excavation for the salt-treating building was

Filling hand grenades

started on May 17th and on lune 1st foundations were ready for six of the tanks, and sill were completed before the 20 tanks that had been provided for arrived. After the tanks were up, overhead rairoad tracks were built above them and with these preparations everything was

in place ready for the first carload of salt on July 14th. The chlorine, gas is used at a themical plant located some detainst away with a tide-water swamp inter vening. The gas is jupied and to maintain the pupes at the proper clevation is wood circuit, eachy hall a mile long, was built between the chlorine plant and the inclinated plant. Work, on the trestile was started May

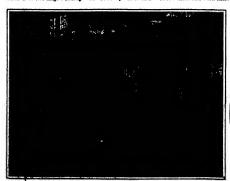

30th and the first pije (line was completed on July 4th. Current for the plant was secured by tapping a source of supply 10 miles distant and bringing it in on overhead cables to an outdoor sub-stanton containing a bank of three 333 km transformers. This station was ready for service on July 1st and while the above described work was in progress, culisted men were assembling the cholmer. cits and on July 4th enough cells had been completed to produce two and one-half tons of obloruse gus per day and diviser it to the chemical plant.

# Fifty Tons of Chlorine per Day

The developments at the chemical plant did not purms the use of the gas at this time and, hence, the plant did not go into operation until the first day of septimber, when the two and one half to nuit was first used. But before the armstine was supped, the plant was randy to produce. 50 toos of chloring as every 24 shours, although the greatest duly requirement at this time was 25 one.

The plant has been designed with the view of increasing the capacity to 100 tons of chloring gas per day, and early in the construction proof, the order was received to build cell building No 2; retary converter building No 2 and to purchess and usual equipment duplicating No 2 and to purchess and usual equipment duplicating that in the first unit. This additional work was produced in the control of the cont

Another remarkable piece of rapid construction was the building of an auxiliary 20 000 kw power plant at (Continued on page 78)

# The Heavens in April, 1919

# More Investigations of Star Brightness and Distances

By Professor Henry Norris Russell, Ph.D.

ONE of the most interesting papers of the past month Comes from Swelen where at the University of Lund a group of very efficient students has been gathered under the distinguished direction of Dr Charlier The present discussion by Cylkinberg deals with a remark able and little understood class of budies the variable stars of long period

Store of this sort have been known for a long time Stars of this sort have been known for a long time-the first discovery that of the famous Mira Cet disting back to the year 1596. In recent years the number of discoveries has grown apace. Of the set all the transfer are known to vary in this fashim and cyllenberg son cludes from his discussion that | retably at least as many

more remain to be discovered there are few more d finite classes of celestral objects The periods of variation the dwars long averaging about did days and are groups I pictty closely about this mean

three quarters if them lying between 200 and 400 the range of variation is great. Two-thirds of those which have been followed through the whole cycle of variation alter their brightness by more than three magnitules that is they are more es as bright at maximum as at minimum-while

one third of them all change by more than fiv magnitudes that is by more than a hundred fold in light—and a few are more than a thousand times brighter at their best than at their poorest

Spectroscopically these stars fall into a very well-marked group They are all decidedly red with spectra showing broad bands, due to the presence in their atmospheres of the vapors of certain chemical compounds—usually the oxide of titanium whose existence proves that the atmo-spheres of these stars must be relatively cool, from the stellar standpoint though from the terrestrial side they are as hot as an electric furnace in full blast dition to these bands and to the ordinary dark lines their spectra show the lines of hydrogen bright, and often very conspicu ous especially near maximum This indi ous especially near maximum. This indi-cates that in some way the atmospheres of these stars contain large quantities of hydrogen which is hotter than the rest of the atmosphere—perhaps something like the eruptions of hot calcium vapor around sunspots which are revealed by study of the sun with the spectroheliograph

But the origin of these spectral peculi-arities and of the still more remarkable variations in brightness remains obscure Anything that can help to clear up the situation is very welcome and Mr Cyllenberg has made an important contribution by obtaining a good estimate of the average

It has been known for some years that the red stars which show the bands of titanium oxide in their spectra—call ( lass M in the Harvard classification - fall naturally into two groups of very different brightness. One group the so called giants averages 50 times as bright as

gunts averages 50 times as bright as the sun or thereabouts. The other group the dwarfs averages less than one per cent of the sun's brightness. Though there is a good deal of difference between anough there is a good dear of difference between individual giants or dwarfs as the case may be, the two groups are a long way from overlapping and as far as we know they are quite distinct

### Classifying the Variables of Long Period

To which of them do the long period variables belong? We cannot give an answer based on direct measures of parallax for only one such star has thus far been oh served for parallax and with rather inconsistent results

served for paranax and with minor inconsistent results But an answer is possible based on the apparent proper motions of the stars in the heavens if these variables are dwarfs they must really be very faint and to look as bright as they do they must be pretty near us—at distances of ten to thirty-light-years, for the most part. If they are as near as this, their years, for the most part. If they are as near as this, their own motions in space and the apparent drift arising from the motion of our own system will early them across the heavens at a rapid race, for stars which could not fail to be detected by observation. If on the other hand they are gainst, they must be at considerable distances, or else they would look brighter than they do, even at maximum, and being thus remot their apparent motions in the heavene would be slow

The writer, some years ago, show I that the motions of the few stars of this sort which at pe ar in Boss s cataof the few stars of this sort whom a plan in holes a cata-logue were so small as for make it very probable that these stars were giants. Mr Gyllenters has repeated this discussion, with considerably n n. extensive data gathered carefully from various reliable sources, and confirms the conclusion. From the verage duft due to the sun's motion he finds that the verage pacellax of 24 such variables is only 9 '005 whi | suid correspond to a distance of more than 600 light ars Working on the assumption that all these star are equally bright when at maximum (which though | mobally not at all areas). exactly true affords a good enough t sis for a preliminary discussion) he finds that, at maximum the long-period discussion) discussion) he lines as bright as the sin and hence is a good bright guant star. At manimum these variables probably sink to the sun's brightness and goods bright guant to the sun's brightness and goossibly below it in a few cases. But it is clear that speaking by and large they are objects of great him ossty.

This settles at least one thing abo it the nature of their

At 12 o clock Apr 7 At 11 is o clock Apr 14 At 10 o clock May 7 At 94 o clock May 15 At 9 o clock May 15

At 10% o clock April 30 NIGHT SEY: APRIL AND MAY

variations They are certainly not stars which are at the variations. They are certainly not stars which are at the point of going out, and flaring up at intervals like a caudic flickering in its socket. The financest dwarf red stars are apparently meaning extinct in according to all the available evidence, but they are not variable, so far so is a triveact known. Variablely of the type is a property of giant stars which the n good reason to suppose to be in an early stage of their career, and it looks at present as though they were perhaps to be regarded as bright stars which become faint at intervals rather than as faint stars which at times flash out bright. rather riam as faint sears when at times made out bright We are still far from a solution of the problem but it is an essential advance to know that we are dealing with very bright stars, which are alm at certainly of large diameter and low density as well

### How Big Is Our Stallar System?

Mr Gyllenberg completes his discussion by calculating the actual positions in space of 700 of these variable stars, on the assumption that their maximum brightness is in all cases 150 times that of the sun. The results indicate that these stars are apattered through a huge region, extending along the plane of the Milky Way to a distance

of at least 4,000 light-years in all directions, while scene of them appear to be not less than 5,000 light-years distant. At night angies to the gladest plane they extend on both ados to a maximum distance of 4,000 light-years of the plane in question. This distribution is family similar to that which was calculated by Shapley and the writer some years ago for the eclipsing variables, though the later calculation makes the inuits of the great star-cloud within which our system has somewink larger It is probable that in limits of the scheme of the great star-cloud within which our system has somewink larger It is probable that in limits of this cloud of stars have been youghty distall, but along the plane of the Gladay; it is not probable that this investigation, any more than others, has "struck bottom," for the study cannot at present be carried to faint enough stars, and the maximum estimated durlance of any of the stars studied by Cyllebneg is but one-third of the distance saugned by Shapley to the nearest of the globular clusters.

### The Heave

At the time set for observation, which is in April an hour later than usual by virtue of the daylight saving,
the Great Dipper is above the Pole, and
nearly overhead Below it and stretching

far to the eastward is the long curve of Draco, enclosing the Little Bear in its colls. Drace, encusing use Latter sear in te cons. Below the Pole are Cassiopers and Cepheus, deep on the horizon. In the northeast Vega has risen, with Harcules higher up on the right, and Corona farther in the same direction, while in the east Arcturus rides high above the tangled outlines of Serpans and Chiburgham. and Ophiuchus

Wirgo is well up in the south and Leo in the southwest Below them is Hydra, with Crater and Corvus on its back Far to the southward, on the horison, observers in Florida or southern Texas may, in clear weather, discern the Southern Cross

The western sky is the brightest of all, with Auriga in the northwest, Gemini on the left, and then Canis Minor Jupiter, which is in Gemini, and Saturn, is Leo, add to the effect

# The Planets

Mercury is an evening star at the beginning of April, but passes through conjunction between us and the sun on the 8th, and becomes a morning star By the end of the month he may be seen in the morning twi-light rising about 515 A M, summer time but he is not very well placed for observation in this latitude

Vonus is an evening star in Arms and Taurus, and is coming steadily farther At the end of the month she remains in view till nearly 11 P M by the clock, and appears about five times as bright as

Mars is theoretically an evening star, but is actually much too close to the sun e visible

to be visible
Jupiter is an evening star in Gemini, and
remains in sight till about 1 15 A M. These apparently remans is agist till about 1 15 A M. These apparently inconsistent statements may be reconsiled by a consideration of the planet a high northern declination and the hour s shift in the clock. Satura is in Leo, crossing the meerdan at abest 9 P M in the middle of the month. Uranus is in Aquarius, and rises about three hours before the sun at the said of the month. Meyticas is in Canore, crosses the meridian at 8 P. M in the middle of the month.

# World Markets for American Manufactures

Edited by LYNN W MEEKINS

A department devoted to the extension of American trade in foreign lands

## Electrical Progress in China

COME yours ago a famous American bandmaster composed a march that still retains its popularity The title, "Hands Across the Sea,' originally alluded to the Atlantic Ocean, but now the same expression is being sha Atlantic Osean, but now the same expression is being used monnection with the Pacific Osean, and the hands generally indicated are those of the Chinese Recently the Chinese Industrial and Commercial Association of Chinege was formed, the first organisation of its kind in the United States I sto-Opicit is to promote commercial relations between China and Amorica At the opening season the Chinese Consul-General at New York brought out the interesting point that the United States is the only country that has not had a special motive in dealing with China Other nations have tried to exploit the -the Americans have tried to help them As a soult, they want to buy five times as much from us in

result, they want to buy five times as much from us in the tuture as they are purchaning now, and \$1,000,000 has been raused by Chinese morchants in San Francasco toward the establishment of a new etamahip line between San Francasco and Shanghai "American manufacturers have a good opportunity at present to develop the Chinese selectrical field, "said an American auginose who visited the Far East lisat years and the fire selectrical services and the necessary ap-paratus and materials Not more than 100 Chinese utiles now have electrical service, but hundreds of others are good prospeate. There are several plants in prospects. There are several plants in Peking, Shanghal, Hankow and Tentan, the foreign and native sections being served by different companies When I went to China, my firm had received very disby different companies When I went to China, my firm had roceived very discouraging reports about the industrial backwardness of the country, the low purchasing power of the people and the active competition of Japanese and British manufacturers. The first of these obstacles will be overcome by the investment of American capital and the furnishing of control of the control of th

# Our Steadily Advancing Trade

The growth of American trade in electrical goods is shown by the value of the imports into China from this country during the fiscal year 1918, which was about during the mean year 1918, which was about \$1,000,000, compared with approximately \$125,000 in 1913 Last year the United States supplied dynames or generators, fans, insulated wire and cables, motors and

States supplied dynamos or generators, fans, naukated wire and cables, motors and telephones. Oppressive summer weather and telephones. Other operated Both portable and central fans are used. Often operated continuously fee a whole day or more, they have to contend with severe humidity conditions that cause in suitable leaks and breakdewns it is so damp along the count from Canton to Shanghas and the north that fans often give annoying above. Under trying conditions the American fan has given much more attactory service than its foreup competitors, and the country service than its foreup competitors, and the country of the

up appearances. When one Chinaman gains an ad vantage over another, the latter loses face and can regain his standing in the community only by getting back at his competitor. So if our retail shop is persuaded to purchase a complete electric lighting system other shops by to meet the standard. In the opinion of an familiar with electrical possibilities in China, small lighting sets can be sold ( ttensively if manufacturers will send agents to demonstrate such apparatus

## Meeting Competition in Telephone Instru

It is reported by an American Trade Commissioner that notwithstanding the theap labor of Japan, American telephone manufa turens and turn out instrument as low-prood as these of their Oriental competitors. Nickel plating sends badly in the humid climate of Shanghai and Its jured brass finish is preferable. Not long ago an American company made the lowest bad in connection with a Chinese covernment telephone contract, but intead of gying it the order the Chinese official in charge gave the American figures.

Japanese travellur commercial exhibition in Manchuria

This Chinese city needs electric lights

to another bidder and placed the contract with him because the official had been properly squeezed, 'that s, fianneally unfuenced in advance.' The American company, however, was looking out for the and finally landed most of the banness in spite of the Official Shanghai is the only city in China where the larger types of electronal cooking and heating applicances have had much sale. When central stations in other cutse and carboly mercased market Modern behang a systems are generally lacking, although the writers, especially in North China, see tigroom. The houseboy and the cook, who prepare the food for foruge residents, do all they are to genourings the use of oad or wood stores, sook, who prepare ass reod for foreign resonant, on all their and to encourage this use of coal or wood stores, because the desired results community to the feet one American hand; who used an electric range found its servants so wasteful of current that it had to go back to the antiquated but chapper coal store

### Selbne Methods and C I F Prices

The methods of selling America of circula goods in China are through the branch house of manufacturers, thing are through the orange in as so insinulacturers, through local importers acting as in unfacturers agents with exclusive sales rights or by bruches of American commission houses. I keep in the case of apparatus bought direct by central stations the importers sell the goods to Chinese dealers who act as jobbers and dis-tributors through outport merchants. These sales are made through compradors who are more then credit men, because they generally guarantee the accounts of their customers. The disadvantage of the comprador system is that the importer is prevented from learning enough about local conditions to develop his business to the fullest extent. He does not become well acquainted with the ultimate consumer and he runs the risk of losing money if the comprador sets aside more than a legitimate share of the profits

The Chinese nicrohants desire as a rule c 1 f (cost insurance freight) quotations—American exporters have been known to quote prices for be (free on board) inland town in the United States and the bids

have been refused because the importers lacked information on American railway freight rates and were unable to figure the freight rates and were unable to figure the cost of the goods landed in China. In one case a British manufacturer named a c 1 f price for certain goods and an American maker quoted f o b at the American laster quored 10 b at the factory. The Chinese importer spoke to the American Consul about it, and with the aid of that representative he figured out delivered prices on American goods, which provid to be lower than the British, and swung the order to the United States Lven when ocean rates make it difficult, if not impossible to reckon the cost insur-ance and freight prices free-on-board at an American port enables the Chinese importer to estimate the total cost of his order The Chinese want to buy a great deal more from us and it is only fair to make it easy for them The most effective advertising for

American electrical goods in China conparticular chop or trade mark of the American manufacturor The Japanese have employed among other methods of publicity, traveling commercial exhibitions publicity, traveling commercial exhibitions in elaborately placardid trains which attract much attention in the towns and villages through which they pass. As new railway lines are built and additional territory is opined it would set im worth while for the branches of American firms in Nanghai Haikov and other Chinese. in Snangnai Dankow and other Chinese, ports to arrange for American advertising enterprises of this sort. The Chinese buyer invariably wants to see actual samples, and this would be an effective way to place American manufactures before him

Extraction of Turpentine in Germany BEI ORL the war Germany imported oil of turpentine from southern France The fir trees of southern France contain less late and more turpentine than those of Germany The latter require a greater proportion of fatty substances to enable

them to withstand the rigors of the German winter

The extraction of oil did not prove remunerative as the
oil-producing qualities of the German in trees compare
unfavorably with those of Pranc. and it is impossible

to make the industry a paying one under the conditions A very easy method has been successfully tested for A very easy method has been successing testes nor the extraction of oil from ir needles the resulting product possessing good technical qualities and remark-able power of resistance to cold temperature. This process has been substituted for the expensive method of process has osen substituted for the expensive method of extraction by means of sichoil, which is practically im-possible under present conditions. Preparatory steps have been taken for employing the process, and in the future the national economy of Germany will benefit by the extraction of several hundred thousand kilos (a kilo-22 pounds) of oil, pure oil of turpentine (turps) will be an added article of competition which according to ex-perts will compare favorably with the French product

# Animating Stationary Signs by Means of Colored Lights

THERE is nothing new in the principle of the absorption of light rays complomentary colors. Indeed complementary colors indeed M Luckiesh a recognized authority or 1 i and illumination and a frequent a tributor to these columns demen trated some years ago the effect on paintings various colored illumination with the various colored minimization with the resultant altert appearance of the pictures to a marked dept. But the re-ise distinct howelth to the practical ap-plication of this principle t advertising signs which is covered in a patent re-entity granted to Richard M. Craig of New Aniono, Lyns.

San Antonio Icxas
According to the specifications of his
patent Mr Craig paints the subject
matter of his sign in two positions one position being shown in red and the other in green Then he arranges both red and green lights for illuminating the sign and alternately switches the current from one group of lamps to the other by means of a motor driven switch. In the accompanying illustration for example is depicted an animated sign consisting of a rocking chair and a see-saw. These articles are each painted in two colors in red for the first extreme position and in green for the second extreme position. In broad daylight the two positions in In broad divigate the two positions in red and green show plantly—but when illuminated alternately with red and green lights, the sign becomes animated in a most startling and convincing manner

## A Phonograph Without Tone-Arm, Sound-Box, and Horn

SOME THING radically new has at last been introduced in phonograph in-struments Indeed the more or less com-plete standardization which has long obtained in reproducing phonographic sounds is now threatened by a recent development which is as ingenious and starting as it appears officient

In brief, the development in question is the climination of the usual tone-arm sound-box and horn Instead the new sound-box and norn Instead the new system of reproducing phonographic sounds makes use of a cone shaped parch-ment diaphragin held in an aluminum ring which in turn is suitably suspended ring which in turn is suitably suspended by a trunnion and swivel mounting so as to bring the long stylus arm to bear on any portion of a disk record—the free end of the stylus arm terminates in the conventional needle holder which takes steel or fiber needles as well as the vario is newel and some or maneut styluses giving the aluminum ring a slight turn the diaphragm is really to play cith a hill and dale out or later dout records It will be noted that the vibrations from

the record groove are transmitted by a long brass hour which passes through the terminates at the apex of the zone is said that this arrangement of inpart ing the vibrations to the parchinent diaphiagm ages more or less of the resonant surface to vibrate according to the barmonic requirements of the vibra tions The cone amplifies the sound to such a degree that a horn is unnecessary in fact it is the chimination of the houn with its inevitable characteristic which generally afters the purity of the sounds emitted by the phonograph disphragm, and which causes a muffled

In actual operation the new phonograph gives pleasing results. On band and orchestra records it gives a fullness and depth of tone that is seldom if ever apph griphs to use f the low matural torc of the jai hment On vocal acketions well

# A Caliper That Carries Its Own Scale

THL time honored methods of calipering a piece of work is to transfer the measurement with the ordinary calibers to a steel rule or to adjust the cappers from a sterl rule ately requires con siderable skill The tool here illustrated

An indicating caliper, a useful tool, which insures accurate

simplifies the process by combining the rule with the calipers, and the gradustions on the rule are chlarged to double or triple scale, so that measurements can be made with accuracy As clearly shown in the picture, one of the caliper arms is formed with a toothed sector which engages a pinion on the other arm. This pinion carries ar indicating hand which sweeps over an indicating scale in the model here shown the graduadrodths of an meh although they are

actually three times as far apart as that, so that it is possible to measure accurately to a three-hundredth part of an inch a larger model the graduations represent sixty-fourths of an inch and are doub scale, so that they can easily be read to half a sixty-fourth

half a axty-fourth. The arms of the caliper are adjusted by means of a trigger placed conveniently mear the handle, and there is an adjusting screw on the handle operated by a thumb nut, which may be brought into engagement with a spur on one of the arms to lock the instrument at the desired meanurement at the desire stred measurement or regulate the opening of the arms to a nicety Provision is made to compensate for any wear in the gear teeth so that the caliper remains always an instrument of precision

# Recent Patent Decisions

With Reference to Novelty .- Patent With Reference to Novelly.—Zacut for a cable hanger by which to attach lead tube carrying electric wires to a supporting steel cable, called a messenger, held valid. This consists of the loop and hooks, a pair of spacing arms ex-tending outwardly in opposite directions from the neck of loop passing obliquely understath and along the sides of the underleath and along the sides of the messenger wire and ending in ordinary overhanging hooks. On first view it seems like the primitive hanger with hooks set above the loop, but on closer inspection it is apparent that the hooks are farther apart, and that they grip in a way the hooks of the early hanger did not —Bonua Mfg (o v Blackburn, U S ( A of Pa

Design Patent vs Mechanical Patent .- The Pick patent for an improve ment in drinking glasses consisting of a shallow bulge below the rim, held valid. The bulge is not ornamental and hence the issuance of the design patent could not invalidate a prior mechanical patent for such glass on the ground of double patenting—I erd Messner Mfg (ov Albert Pick & (o USCC A of

Option to Take I icense -- Provision of contract giving one the privilege of becoming at a certain time, exclusive heense to manufacture under a patent, provided he give 10 days notice of his intention, and within such period furnish a bond, gives but a mere option, as to the exercise of which time is of the exence—
Lafe Preserver Suit Co v Nail Life Preserver Co U S ( ( A of N Y.

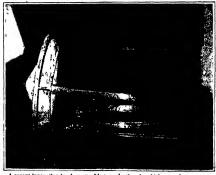

No Jurisdiction .- Equity is without No Jurisdiction.—Equity is without jurisdiction of a suit for infrangement, where defendant had used only one of the alleged infringing machines, had ceased its use and dispessed of it months before suit, and did not threaten further use.—Mumper Ldy Co v Natl Marking Mind: to U S C A of Jones with its Disclosure?—In a suit to many office of the suit of

enjour infringement of patent, where plaintiff claimed that the present commercial form of his invention was not a departure from the original disclosure. plaintiff had the burden of proving that any journeyman of the art could turn from present form to former with any certainty of result. An inventor mute do more than give cues for future exdo more than give cues for future ex-periments, and, unless he is dealing with elements whose action and resection is known and certain, he must disclose how the combination will operate.— H Ward Learned, Inc. w Mazusell Meior Sales Corp. U.S. C. C. A. of N. Y. Basis for a Patent.—The only bigsis for granting any patent is the specifica-

ed on page 227)

By painting signs in red and green and using alternately a red and a green light, j startling azimation may be secured

A recent innovation in phonographic reproduction, in which a parchment come acts as the sound-box and horn combined

# TIMKEN

# Why It Means a Well-Built Truck

Dotted lines show how the inside of the "cup" of a Tunken Bearing is tapered to fit over the tapered rollers.

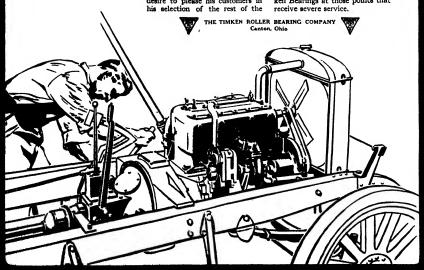

When you find Timken Bearings in a truck it's a pretty safe indication the truck is well built. The bearings cost the manufacturer more than other makes but he was glad to pay more because he knew these bearings would go far towards making the truck give you good service.

If a manufacturer displays his good faith and incerty in the instance of bearings, you feel assured he has shown the same desire to please his customers in

car's equipment. He has purchased the very best that the market affords.

As proof of this, just put down trucks that you think of. Or take twenty, or fifty, or as many as you can remember. Check up these names with the list included in

"The Companies Timken Keeps"
—a booklet we will send on request—and you will find the big
majority are equipped with Timken Bearings at those points that

# Fires cost more than fire prevention

IN America, of all the countries, fire's course is the most destructive. The tax it lays upon each one of us is four times greater than that in European lands (see chart at left). In this there can be no indictment of our own fire-fighters, the admiration of the world. The indictment lies rather upon our ways of building. It lies upon our inflammable roofs, through which fires spread—just as the way to community and personal fire-safety lies unquestionably in Asbestos Roofing, that repels fire, limits it, confines its destructive powers.

Among thoughtful people everywhere Asbestos Roofing is accepted as Nature's best defender against city-wide fire-threat—made great or small, according as each among us gives this fire protection to his own property. Asbestos Roofing is the true Sentinel of Safety to communities, whereever it is used.

"Asbestos" and "Johns-Manville" are words that are almost synonymous today. Just as Asbestos is Nature's greatest protector againstfire, so Johns-Manville is the greates: authority upon Asbestos Roofing. There is a Johns-Manville Asbestos Roofing for every building structure—regardless of its cize or character.

Johns-Manville Asbestos Roofing satisfies every possible roofing requirement. Its use grows greatly. And in the proportion of its growth America's line upon the fire-chart above will be reduced.

# WILLIAMS' SUPERIOR

Drop-Forgings and Drop-Forged Tools

Wilhams' "Vulcan" Drop-Forged Chain Pipe Vises are the only tools of their class made ntirely of wrought steel. They are unbreakable, rapid in action and at-

tachable anywhere—any handy bench or post will serve

The compact design of these wrought Vises is in strong contrast to the bulky and clumsy cast product pre-viously used-their light weight is an unusual fea-

ture in tools of their capacity They are carried in stock in three sizes, for 1/8 to 8 inch pipe

All that Williams Superior Quality means is embodied in these tools and Williams immediate service enables you to get these when you wan them. Your dealer will supply you or we will ship direct.

"The Drop-Forging People"

Western Office and Warchouse 28 80 Clinton Street Chicago, III

General Office 28 Richards Street Brooklyn, N Y wholes Formerly it was possible to affect tion of fa only by converting the radiant energy estima is ingute host Satisfactory shough in some character assensetions, this impation was, in others, in colors a source of mannyeniance and error Ac aordingly the Bureau of Standards has for cordingly the Bureau of Standards has for 10 years or more been pursuing the subject, with a view to establishing standard procedures of a definite character, and in a recent summary of the week to date, published by the Bureau under the title Scientifi Paper No 219 some very in-teresting results are disclosed

seresting results are theoresed. In the radiant cargy is absorbed by a blackened receiver and converted tall to heat, which is then measured in various ways. In the Nichola radiometer, the absorbing members are vance supponded in partial vacuum, and the boorbed energy affects the molecular a tion of the gas remaining in the chamb r sufficiently to cause a reaction in the form of a rotation of the vanes. In the thermopule the thermocouple is used, depending upon the fact that when the runction if two different metals is heated. punction if two different messais is faster, an electric current is set up. For the purpose before us, the heating is here done by the heat generated from the absorbed energy and the resulting current is measure i by a galvanometer Still another type is the Langley belometer, in which the city of presence of a metallic makes it is the control of the which the electrical resistance of a metallic strip is changed under the influence of the all of these successful devices, measu ment of radiant energy has been attempted on a basis of the expansion caused when it m shearhed by a gas or a motal and con-verted into heat but this procedure does not aff rd sufficient accuracy to be considered scrously

The outstanding feature of all these m-stallations lines in their mability to pick out a frum of radiant energy of a partout a run or radian energy of a particular wave length or even all trains within a given rage. The rays which have so far been measured vary in length from 000001 inch in the extreme ultra-violet to 01; for the longest infra-red rays yet isolated. The absorption radiometer re-acts indifferently to stimuli throughoutth is range The several types vary only in speed if it requires two seconds obtain a galvanometer reading, the thermo pile will take three or four seconds, and the vane device may need as much as four or five minutes

Now this universal sensitivity may well Now this universal sensityry may wail be an advantage in cases where we wish to measure the total intensity of a highly complex beam buch a measurement plainly could not be made with a single instrument of restricted range But instrument or restricted range for the other hand if what we want is to detect the presence and measure the intensity of certain wave lengths the non-selective apparatus is worthless. We must device an instrument which will react only to th lengths with which we have to do
in privious communications, the Bureau
has directed its attention principally to the non-selective and selective types, findthe nn-selective and selective types, unding these of wider application than nativa-ments which respond only to certain frequencies wheth respond only to certain frequencies whether visible or not. But it has been found desirable to turn now to the other kind, and the report which we here summaries records the efforts made to develop a satisfactory selective indicate.

tion of the energy in stan-come of the substance of characteristic material has a in resistance for radiotion lengths which are least about ugus wron ere best absorbed Unfortunately, inverter, the

cell and its commen are not well the purpose in band. The set depends upon host treatment, an not only with the ways-length attraulus but also with the indense depends upon heat bestiment, and sugins, not only wish the wave-length, of lives attrautus but also with the interaction, and in the control of the control

vacet and ultra-violet When thus used they are designated photo-electric cells The photo-electric cell coems to become fatigued, and its The photo-electric cell ceess to become fatygued, and its response a not directly proportional to the intensity of the stimulus but unlike selensium, this lack of prapartionality does not depend at all upon the wave-langth. This device accordingly appears to meet the requirements of a quantitative radiometer. It may be sfectively used for measuring ratios of intensities extending from the bite throughout the ultra-voice part of the spectrum under this investigation should apply to the Bureau of Standards for Scientific Paper No. 378, the price of which is 10 cents

# Air Serooms for Furnace Workers

AN account was recently given in a C German stechnical paper of the intent methods remployed in Germany for estreac-ing furnaces. Workers tending farmission, and required the examine the gloreling inst-terial at frequent intervals, aftered a given deal from the excessive heat endistaid, and are considered to the contraction of the concent from the accessive terms actions were accessed to intelligence for the condet furnace doors have been free obclossity they afforded particularly white closed Again, devices have installed for drawing all the lot are in Perhaps the first thing that would occur within elected Aguin, devices have possessed to an investigator in this field is that the interest the property secretary and the latest the product of the possessed that the product of the possessed that the property secretaries of the later, would afford a fine posses of the later, would afford a fine possessed that the property secretaries is discontinuously behalf and objection to these is this very use attack. The property secretaries is very secretaries and the possessed of the property secretaries that of decreasing electrical restart and the property secretaries and ultra-volve portions of the easts. It is also also the property secretaries and the property property of the easts. It is also as a secretaries and the property of the property the p

Alma, Mich.

# Model 19-Republic INVINCIBLE 2-2½ Tons Model 20-Republic DREADNAUGHT 3½ Tons

Founded on experience gained through building more than 50 000 motor trucks. Republic announces two improved models

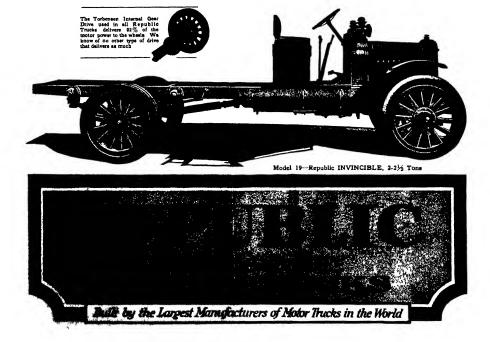

Developed from a careful study of the needs of motor transportation in every industry and binder exery road load and climate condition encountered in the 27 countries in which the "Yellow Chassins Trucks have served so well

In basic design these improved Republic models adhere to Republic practice which has amply proved its correctness through five years of constantly increasing public confidence But many improvements have been made to give increased service and value

Continental motors of great power are used in both models. A 4 speed transmission adds flexibility. Enlarged radiators give increased cooling capacity equal to any emergency. Perfected oil governor absolutely controls speed and delivers full power at all speeds. Rear spring suspension constructed according to government design. And every mechanical feature is kept in perfect balance with the truck as a whole. Every improvement that could be logically dictated from Republic a vast experience has been incorporated in the Republic INVINCIBLE and the Republic DREADNAUGHT. We believe they set new standards of truck value that users will be quick to appreciate, and they are ready for immediate delivery.

More than 1400 Republic Service Stations insure continuously satisfactory service to every Republic user.

# SCIENTIFIC AMERICAN

# WILL YOUR MOTOR TRUCK BE AN ORPHAN?

THERE are thousands of truck orphans left on the hands of their owners. Their makers have gone out of business. It is reported that, of 555 companies organized since 1909, 331 no longer exist. Half of the remaining are less than two years old. 228 lasted but a year.

Making motor trucks is a large scale operation. Only the resourceful succeed. Some makers lack the capital. Some lack the output for economical manufacture.

Motor trucks are an investment. Rightly used, they should earn dividends large enough and long enough to write themselves off the books and then make a clear profit. The investor in a bond is as keenly interested in the soundness and stability of the issuer as he is in the terms of the bond. So the purchaser of a truck should be interested in the permanence and stability of the maker.

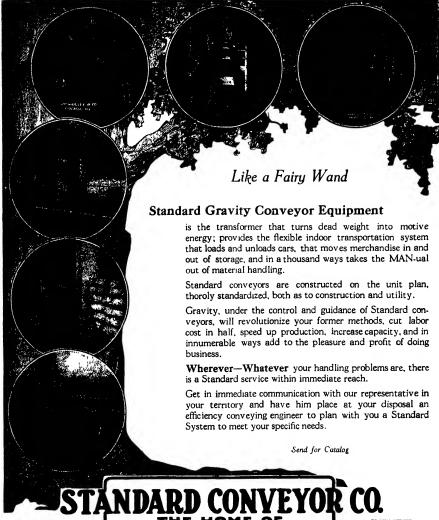

Any mechanism designed to last is

a doubtful value if the maker can not be counted on to remain in business and back up his product. The purchaser invests also in the maker's experience, in his reputation and in his service facilities. Of what use is a truck if parts are no longer available? What resale value does it have without a maker? Who will furnish service to the owner?

A purchaser can judge these things by: Years in business, Financial statements, Performance records, Number of trucks in service, Size and growth of output, Reputation of the product, Service facilities already established.

The Purchaser of a White Truck Backs His Investment in It with the Strength of The White Company, with Its Years of Successful Experience, with Its Thousands of I Trucks In Active Service, with Its Millions of Capital, and a Service Organization, Nation-Wide, which Has No Parallel in the Industry.

# PACKARD TRUCK VALUE MAKES PRICE INSIGNIFICANT

Which is Better Business? \$4,000 for 100,000 Miles or \$3,000 for 50,000 Miles?

ROFESSIONAL appraisers say that the usual rules for writing off depreciation do not apply to the average motor truck.

Their experience shows that in many cases the truck is discarded before its value is covered. In others the maker goes out of business, and parts are hard to obtain. Out of 109 truck builders listed in 1911 less than a dozen and a half are in business today.

Packard depreciation is a known quantity. It is written off at the same rate as that of any fine machinery.

The low rate of Packard depreciation is responsible for the remarkable resale values of Packard Trucks.

There is always a market for a Packard.

The stability of the house is partly responsible for this condition — Packard parts for every model made are always available and at fair prices.

Packard design and engineering is chiefly responsible.

Which is better business?

To divide up \$4,000 original invest-

ment among 100,000 miles of service—or \$3,000 investment among only 50,000 miles of service?

Original cost of a truck means nothing except in percentage of total transportation cost.

The original cost of a Packard figures out probably a lower percentage than any other truck on the market.

And how can a truck that cannot show 100,000 miles of service try comparisons with a Packard!

Which is better at the end of three years? To have a utility value of two-thirds what you paid for each truck—or to have merely scrap value?

Let a business man buy efficient freight transportation and he buys an asset to his business. But if he buys a motor truck unrelated to the best uses he can put it to, he buys a liability.

Freight transportation economy is gained by using trucks of the proper capacity and built for long life. The most expensive part of motor trucking service is the thousand dollars somebody tries to save at the start.

The first step in placing trucking on an economy basis is to get in touch with the Packard Freight Transportation Department for analysis of your hauling problem and to indicate the right truck for your work.

Diagram showing the Roosevelt Tunnel and the Cripple Creek mines that it drains

## The Roosevelt Deep Drainage Tunnel Finished By C Bond Harpole

THE Roosevelt Deep Drainage Tunnel in the Cripple Creek, Colo, gold mining district one of the longest and most hasardous engineering feats of its kind ever attempted, has been completed after 11

attempted, has been completed after 11 years of panistaking effort and tremendous cort. The tunnel us one of the longest mining tunnels in the world, the total length from portal to breast being 24 355 feet, or approximately 46 miles In January, 1918, the total water-discharge at the portal was about 4,000 gallons per minute, but it steadily declined and now infowing about 2,000 gallons a minute The maximum discharge was 17 000 per ainute, this coming in the early part of aniute, this coming in the early part of ane maximum discharge was 17 000 per minute, this coming in the early part of 1916. The tunnel cost nearly \$815 000, the average cost per lineal foot being \$32.30.

833.50 The year 1906 operators in the Crupple Creek gold-mining district found that ore bodies on the upper levels were fast being exhausted and that they must start more development work There naturally was only one course to take and that was to aink their shalts deeper which they did The Portland Gold Mining they did The Portland Gold Mining Company was one of the first to start car-temative development work of this kind but the engineers, after sinking the shaft to 1,200 feet, began to encounter a great deal of water, which seriously hampered operations Pumps were matalled but it was quite evident that a more satisfactory d of draining the mines had to be invented or development work could not go forward unhindered

forward unhindered
So it was that the Rocewell Deep
Dramage Tunnel had its birth In 1907
Albert E Carlton, enganers and practical
sines, organised a tunnel corporation
among the preducing companies and made
the huge bow possible Carlton cuttined
a plan for driving a drainage tunnel to
connect with the principal indice of the
distents and to furnish an outlet for the

underlying bodies of water. In the legiming reputable mining engineers acoffel at he plans delaring his scheme was impractical but the remarks dil not dampen his outhusiasm and to the source of the soffers are aiding in development work in the low levels of mines unwatered by the tun I that before mayor could

The pertal of the tunnel, showing the delivery of water

have ben operated. Carlton not only took the first contract first ring, the worl lat put up a considerable portion of the funds and continued to do so until it was emplet 1

## The History of the War

HO will write the history of the late war? Histories of course will be written by the score by the hundred but who will produce the one great chronicle writing with such an authorita tive and impartial non-that men shall accept the record as conclusive and final If such authority can be found much controversy will be saved -and the writing of many and uscloss books. We doubt if any field of literary dispute has been so fruitful of fruitless discussions as that of military history and in saying this we do not except even the theologians

The great work abould be undertaken at once for every years delay serves to obliterate the record | I des may be mislaid personal note books lost or thrown aside in thoughtless disregard of their worth the older men who directed the war do off the younger men who fought in subordinate command or in the ranks return to civil life and become scattered to the four curners of

The demand for a highly authentic history is far more pressing today than it was at the close of any previous war of importance for the colossal magnitude of the thing whether it be measured in terms of men materials or geographically in terms of its far-fluin operations will render the task of collecting arranging and recording the data in their proper sequence one of extraordinary difficulty

Hitherto, such tasks have too often fallen to a layman, who made up or attempted to make up for his lack of military judgment by a display of his literary gifts More often than not the historian has been swayed by an uncontrolable bias forgetting that it should be his first care to exercise that impartiality in the presentation of his facts which characterizes a judge's charge to the The mevitable result is to start a controversy that may descend to the third and fourth generation

Consider the 1huty Years War of which so many labored histories have been written. The best known of these were the output of man who were either Catholic or Protestant such as lauseen and the violent partisanship of their authors breathes in every chapter and vitiates the value of the work as impurish and illumi nating history Or reflect for a moment on the eternal controversy that has raged around the question. Who won the Battle of Waterloo? The British will tell you that it was the dogged persistence of the British infantry formed in squares to withstand the furious Cuirassiers of Napoleon Victor Hugo says it was a shower of rain and a sunken road. The Germans, well of course, her won it they are getting ready to tell us that they won this war morally psychologically or in some way or other At any rate unless the plan we are about to suggest be followed it is quite possible that the children of future German generations will be taught that the whole world consumed to crush Germany and that after vainly trying to do at for four and a half years, in which they never set foot on German soil they were so worn down and discouraged that they gladly accepted the German suggestion for an armistice

We suggest that with a view to having the military facts presented to the world in a history of such high authority as shall silence all doubt and shut out useless controversy, the Peace Conference arrange for the General Staff of all the Entente nations to collaborate in compiling a history of the Great War from the first clash of armies in Belgium to the glorious consummation on November 11th 1918 The Cerman and Austrian Staffs should be invited to contribute the history of the operations from their own side of the battlehne As Ldstor of this work no better man could be found than Foeh War College Professor Chief of Staff and Commander in Chief of the Allied forces

Here we would have an ideal war history -a source book upon which individual national historians could base any works they might feel disposed to write If a nation felt that it was entitled to say. We won the war. ht its historian go to it. The book of Truth would be there before him with its lists of total expenditure total enlistment total wounded and total dead. He could turn to the record of battles won and lost of total front held and finally of the total months spent by the several nations fighting on the various fronts. This sort of literature is inevitable but in view of its inevitableness, let us have the one great, official unbiassed story told by a composite group of the Allied Staff officers who alone know the whole truth and are sworn when they speak, to tell nothing but the truth

# The Trans-Atlantic Flight

ACH were no control train-Atlantic flight control Already are well over a half-dozen recognized parameter well over a half-dozen recognized parameter well over a realized to announce their ACH week brings forth new entries in the great ticipants and many more are about to announce their entry in the greatest competition in aviation history In fact the trans-Atlantic flight is rapidly becoming a race for there can be little doubt that several participants will succeed in making the crossing within the next few

To those intimately familiar with recent progress in iviation it is somewhat surprising that the trans-Atlantic flight has not yet been achieved From day to day an autouncement of the fest has been expected and it was with little surprise that aeronautical men read of the rumored start of a French (audron from Dakar on its way over to Pernambuco in Brazil via Cape Verde Islands and St Paul Rocks But upon looking up the status of St Paul Rocks in the atlas it soon became evident that the intropid French pilot would have a difficult time locating these maignificant bits of land in the wide expanse of the southern Atlantic, unless little short of a tape line had been laid acros the water to guide him on his way. However, the rumor proved to be more or less unfounded, although it is known that the French airmen have been considering this route because of its short jumps

It would seem that, given refucing facilities at sea, any one of the large seaplanes now available in the United States and Great Britain could long ago have made the trans-Atlantic crossing But when a non-stop flight is considered, the problem becomes considerably more difficult, and many of the existing airplanes with flight ranges of 1,000 or 1,200 miles are eliminated. In truth there are very few planes immediately ready for a non-stop flight of about 2,000 miles which is the distance of the trans-Atlantic crossing from Newfoundland to Ireland allowing for such drift as may be encountered in aerial navigation over such a course

The British have several dirigibles of great cruising range available for the flight. It would seem that the dirigibles might easily have crossed the Atlantic within the past month or two, since in thights over the North Sea at least one of them has covered 1 420 miles without landing Another British dirigible has cruised for almost a week without alighting. The latest and largest Butish dirigibles, the R-15 and the R-34, are now ready for the great flight, with a competent crew of officers and men formerly in the Royal Navy Quite n cently these airships have been crusing over the Atlantic instead of the North Sea, and it would be quite sample matter for the pilot of one of them, finding the weather and conditions ideal to continue an experimental flight westward until he touched some point of North America Thus the flight would be achieved without previous announcement and without extensive preparations such as are almost certain to mark any attempt with a heavior-than-air machine. So it is that aviation men have momentarily expected to hear of a British dirigible landing in Nova Scotia or Newfoundland after a successful erossing

At any rate, the trans-Atlantic flight is now being approached in all earnestness. There is Captain Sunstedt with his graceful scaplane, the British with the Sopwith two-scater to be prioted by Harry Hawker and seut -Com McKensie Grieve, and the Porte triplane, the Americans with the Model T flying boat which carries five Liberty motors and has a cruising range well over 2,000 miles, the French with their Caudron which has a range well over 1,200 miles, making it eligible for the shorter southern routs the Italians with their Capronis which, it is understood are being rushed for the competition, and many others not yet antiounced Some time in April ought to mark the first flight across the Atlantic, with either the British or Americans as the most likely winners of the London Dauly Mau prize of \$50,000

# Scaplanes for Fishing and Oceanography

TARIOUS interesting suggestions are cropping up in response to the pressing question What m to be found for the vast fleet of aircraft acquired during the war by the recently belligerent governments? One of the latest comes from Professor Joubin of the Oceanographic Institute in Monaco

An important business of the scaplane during the war was hunting submarines As is well known, a submarine, when not too deeply submerged, is easily seen silhouetted against the sea-bottom from a point of vantage a certain distance above the water The same is true of the larger species of fish A good-sized mullet, for instance, can be seen from an altitude of two or three hundred feet, when swimming over a sandy bottom. While smaller fishes cannot be discovered in the same way when separate, they are readily seen when swimming in shoals is the habit of so many valuable food species, such as the sardine, herring, etc.

Professor Joubin proposes the establishment of a regular patrol by hydroplanes over the various fishing grounds These craft should be equipped with radioelegraphic apparatus, whereby they would notify the fishermen of the neighborhood whenever a shoal of fish, was located This plan would result in a great saving of the fishermen s time. It would also ensure a more eronomical use of expensive bait, such as the peanut flour and fish roe, used in sardine fishing

A moving shoul of sardines several feet below the surface (and this is also true of various other important species) is distinguished by a characteristic glitter, due to the reflection of light from the fishes scales An observer fiving at a moderate altitude could easily detect this appearance. The tunny of the Bay of Biscay feeds on a certain crustacean, Ruther sale bispinosa, which lives in immense swarms, coloring the sea rod over wide areas. As these red patches, which be-token the presence of a school of tunny, are easily seen from the fishermen's boats they could doubtless be located even more readily from a seaplane It is suggested that the tunny fishers would do well to aband their sailboats for motor-boats, equipped with refrigerating apparatus Ahead of the fleet of fishing boats, when it puts out to sea, should go a few serial scouts, whose observations would promptly determine the whereabouts of the tunny and its favorite food
The sperm-whale fishery, as carried on in the Asores,

may be mentioned as an industry that would profit immensely by the use of airplanes The whalers maintain observation posts in these islands on the summits of high cliffs, at which sometimes months go by without a single whale being sighted The advantage of substituting the airplane for the fixed station on shore is obvious

There are also many kinds of hydrographic and oceano graphic research that could be carried out to advantage by means of suitable aircraft M Joubin has pointed out that, in clear weather, and regardless of whether the sea is smooth or otherwise, it is easy to observe the character of the ocean bed at moderate depths Differences in color serve to distinguish mud from sand, gravel from rock, etc , as well as the characteristic algal vegetation Seaplanes might well be used for mapping these features, in the interest of the fisheries, the seaweed industry, etc Photography could doubtless be present into service to facilitate such an undertaking, and various adaptations could be made in the aircraft to fit them for the special work in hand, such as the installation of a telescope in the bottom of the machine to reveal im-

Professor Joubin is a veteran student of the sea, and his suggestions are worthy of serious consideration.

## Naval and Military

French Get a 75-Mile Gun — A dupatch from Paris states that the Germans have agreed to hand over to the French one of the 75-mile guns which bombarded Paris Following to transfer, the French authorities will done less publish full particulars of this much-advertused waspon, and we shall know whether it was a new design from the ground up, or whether it consisted of a 50ciliber, naval, 15-mch gun with a liner reducing the caliber to 82.

We Need Fast Armored Ships—It is to be hoped that the decision of the Government to postpone the building of the six battle-crusers will be followed by an aarty decision to build something in their place that will combine high speed, great gun power and good protection. As mattern now stand our navy has nothing that could catch the battle-crusers of some of the foreum powers. A decision on this subject should be made at the earliest possible moment and construction runked on the new ships

Cavalry Not Out of Date —That cavalry us still a necessary and important branch of the army is emphasized by the Army and Newy Journal which quotes an officer of the General Staff, an authority on the cavalry arm, to this effect. He has pointed out that until the arplane can be used as a means of rushing forward resinforcements and for reconnaissance at night it cannot supersede the cavalry. Reference was also made to the signal success stained by General Allenby against the Turks in Palestine which is attributed largely to his evalry action.

Changing the "Troy" to a Troopship—One of the largest purely freight ships in existence is different purely freight ships in existence is different purely freight ships and the state of the Allanie Transportation Line Her beam is 75 feet and she is between 600 and 700 feet in length. The vessel is now at the Hetcher Yards in Hoboken where she is being converted into a troop-carrying ship. The work is said to involve the construction of 10 000 hunks. I has great number is possible only if the whole of the space on the various decks as devoted to troop carrying. The vessel is controlled by the United States Shipning Soard

Compensation for Builders of Wooden Ships—
We are pleased to learn that the Intel States Shipping
Board will protect the wooden shipbuilding companies of
of the country from losses which are due not to their
own fault, but to the eugencies of the war situation. A large number of enterprising men responded to the call alarge number of enterprising men responded to the call alarge number of surface production and a great number of yards were land down. This work was undertaken in perfectly good faith and it is only just that the Covernment should make a careful examination of the lawful which put whole-souled effort into the task of the surface of the companies which put whole-souled effort into the task of building ships, be permitted to suffer the serious financial loss with which many of them are threatened

Cost of Relining a Gun —Froston promises to be the bide not of the artillerist for many years to come or at least until that happy day arrives when somebody and all that happy day arrives when somebody on temperature. However, the problem has been considerably seaded of late years by the practice of relining, saderably seader that a relined gun is practically a new gun. We understand that a jet-ined gun is practically a new gun. We understand that a jet-ined gun is practically a series of the series o

Sime Urges Rigid Airships — dimiral Sims has recently sent a measage to the Navy Department in which he says 'I say thoroughly convined from my observation of the naval lessons of the save that me future rigid simblings will be a part of the fleet of every first-rate power.' He verifies the statement which has already appeared in the press that England has a number of large sizehigh sultit and building, some of the new ones to be 965 feet long and of 2,700,000 cubic feet respectly with a maximum speed of 59 knots a crusing speed of 38 knots and endurance of more than 200 hours. He states that the Admiralty is planning this summer for a flight to the United States and back with one of the British rigid sirehips

Electric Soldering Device \ \ novel soldering device for hight soldering work in which the metal to be soldered is heate i dire the by an electric are established between two eart on points has been developed by H. Hendricks of Detruit Mich Clusing the tool brings the solder into ontact with the electrides. The device is designed to be attached to a six volt storage battery but can of course be used on ordinary lighting voltages in conncets n with a step-down transformer. As pointed out ty Mr Hendricks all of the heat is applied directly at the p int where it is needed and only during the time necessary for soldering so that about one tenth of the energy consumed by other soldering irons of equivalent capacity is required. The device is always ready and the workman does not have to wait to heat up the tool before making use of it. It is of light and simple construction and the way in which the solder is fed makes for the greatest economy in the use of soldering material

Flectric Meters for Street Cars - The Electric Railway Journal gives some instances of the utility of meters on street cars with a view to checking waste of energy Some comparative tests made with the same comment on kyel lines and gradients show that as much as 26 per cent saving in energy could be made in this way Originally 2 093 kilowatt-hours per car-mile was obtained in a test in which the dials of all meters were kept covered so that the driver could not obtain any information as to the current he was taking Suh sequently after a period of training in which instruction was given on the handling of cars by observations of meter readings an energy saving of 0 253 kilowatt hour per car-mile (about 12 per cent) was obtained in spite of the fact that clumatic renditions were less favorable than in the first trials. On very severe hilly routes it was eventually found that the energy consumption could be reduced from 341 kilowatt-hours to 252 kilowatt-hours per car-mile-a saving of 26 1 per cent mainly due to better handling of controllers and brake eaupment

A New Device called a hospital call switch has just been developed by a large electrical manufacturer in Milwaukee It is made for installation in a standard switch outlet box and the wiring for it does not extend beyond the box. No flexible conductors or pendent switches are required for its use and consequently the annayance of having these parts worn or broken is elimmated. It is so constructed that the patient can only complete the circuit to signal the nurse and the nurse can push it off only at the bedside. Lurther as the live parts terminate in the wall there is no possi bility of the patient coming in cutset with them Therefore it has none fithe bjectic nable features generally present in such systems and is a means of making nester and cheaper installation. A pull chain to which a linen cord is attached is used to pull the switch on The push button I cated above the horn through which the pull chain extends is used by the nurse to push the switch off In a ward where two or more switches are used on the same signal the protruding button indicates to the nurse which patient The signal remains on therefore until the nurse comes to the bid to much the switch off The plate is the same size as those used for electric light wall switches and receptacles. The new device may be used on any standard lighting circuit of 125 volts or less

# The Prevention and Cure of Hookworm

Causes and Extent of the Infection, and How It Is Being Stamped Out

This brought to our attention by a local correspondent that as the result of examination of 15 000 persons in the coastal regions of tropical Queensland, for Waite the Rockefeller Institute has found over 20 per cent of the white population and fr in 7a to 95 per cent of the aboriginals to be infected with the hookworm parasite The Rockefeller Institute has offered to cooperate in the The too sector institute has one rot to cooperate in the eradication of the earl which is now confined to a small portion of Australia but which will probably apreal widely of not taken in hourd. So far however, nother the Queensland State nor the televial Covernment has manifested any willingness to bear the necessary ex-

manifested any withington to their its interestinated the whole is refused in not peruliar 1: one section of the world. If our out's 1, attribut 1: the presented lack of understanding in the len interest in the peruliar lettering of the mindry in questin. The pupilar lettering of opinion is not definitely a unif in 1. In the ordinary acute epidemic discusses there is in element of the popular managination. The patient is well to his sick in bed tomorrow the disease has its very visible mainf stations, which run for a more or less of finite period, the patient either dies or gets well. But hol worm disease is like tuberculous, only more so. There is nothing of the spectacular in it it is not active but chrom—the patrial runs down so. gradually that he fuls to a dize that he is sick he merely confesses to not feeling will a very large distinction to

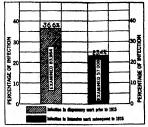

any save an actual student of medicine. There is 10 definite onset no sudden prostration to suddenly ar quired symptoms even. He nationt is just run down of much difficulty to conthought and action that here is a definite disease and a serious disease—a disease moreover that is communicable—yet a discuss that is amountly to specific treat ment, and worthy of such

The hookworm disease is one whose method of communication is even more roundabout than that of bulsonic plague. It is caused by a small parasitic worm Unimaria, about as thick as an ordinary pin and about half as long Thousands of thalf as long Thousands of these may live in the intestine of a single person in one case more than 6,000 were passed as the result of treatment. While the female produces as many as 2,000

eggs per day these never mature within the host but only after leaving the body in the facces. Under proper conditions of air, heat and moisture they then hatch within the brief space of from 24 to 40 hours Once hatched the larvae too small to be seen with the usked (ye may live on and near the surface of the ground for

many months, in a state of more or less arrested develon ment and so long as they thus remain in the soil they thus remain in the soil they retain their microscopic size. They get back into the body of a fresh host by boring through the skin of the bare hands or feet or any other ports m of the body that may come in centact with the soil

Having thus centered the human cream no they have yet t d me traveling before they me able t develop in 11 meanicus to health. After foring to health Aft r lorn g the lymphatics is cirrical through the beart in the ordinary course of circult tuon, penetrate the lung and finally reach the throat finally reach the throat where they are swallowed,

Percentages showing reduction of hookworm infection

in the ordinary course of events they then proceed to the small intestine. Here they remain at l gr w to maturity to carry out the last stage of their life evels. Unless disturbed by treatment, the individual worms live for seven years or more in this, their final home, nourish-

A Ceylonese girl before and after treatment

ing themselves by sucking the blood of their host. It is an open question whether in addition to this action, the worms cause changes in this blood which tend to destroy the hemoglobin. Whitever the process, severe infections are followed by a vere anemia

The world-wide distribution of the hookworm infection

dran who develop the diseases are stunted physically and mentally, and in extreme cases practically unsexed. While the hook worm anomal send disesty to deash only in a few extreme case, persons harboring the infection are, naturally, more susceptible to such makeles as makeria, typhoid, pneumonas and tuberculosis. Becommonally, perhaps its most errous effect less in the great loss of individual working efficiency. Even where it is not especially severe, it results on the contract of the co than even thus

For the very reason, as already pointed out, that it is not spectacular, hookworm disease is the greater menses. Acute diseases not seldom tend to strengthen the race by killing off the weak, but this infection, working so insidiously as frequently to escape the attention even of its victims, tends rather to debilitate the race by attacking the strong as well as the weak The cumulative effects of the disease on the race—physical, economic, intellectual, and moral—which are handed down from generation to generation, through long periods of time are even more important than its direct and indirect contribution to the death roll among individuals. This one disease, when infection becomes general, may go far toward explaining the retardation of backward peoples.

waru explaining the retardation of backward peoples. Hookworms were first discovered in 1838, in the body a peasant woman at Milan There is no doubt that

for centuries before this they had been prevalent as a distressing and disabling factor among the nhabitarie of tropted and sub-tropted countries between the parallel 86 degrees north and 80 degrees south. The degree of indection, of course, vance widely, some idea of its severity may be gathered from the figures in a number of infected regions. In one distance of the Cabe Subsequent of the Subseq factor among the inhabitant showed only one or two who were free—an infection of tion among the rural popula-tion of the plains of India averages 80 per cent In the language Valley of China is is conservatively estimated that 90 per cent of the farmers that 90 per cont of the farmers suffered for those areas of Ceylon, Fur, Seychelies and Sam in which the International Health Board has carried on operations the average infection is 951 and after treatment per cent. For Ceylon alone properties that the carried of the period of the control of the farmers of the farmers of the farmers of the control of the farmers 
per cent

From what has been said as to the manner of com munication, it will be realised that prevalence of th

disease is due entirely to lack of proper disposal of human excrets. If these are so handled that their content cannot reach the soil to pollute it, the problem is solved. The campaign solved The campaign against the hockworm there-fore takes two directions-the spread of infection is to be checked by adequate to be cheesed by accounted as anitary installations, and the members of the community who are infected age to be cured if this be possible. What the first item means

is difficult to realize on the part of the average cavillated community, where sanitary arrangements that are at least decent in their ex-ternals have come to be the accepted thing. The condi-tions under which what the (Continued on page \$55)

# American Invention That Played an Important Rôle in the War Against the U-Boat

By Brewster S. Beach

A FIRE meaty two years of the closest censorship, the Justice Sistem Navy Department has given approval ment in the United State of Law Department and the special means in the United States during the way, of submarine driecting devices, which were used to agnal advantage by these country and the Allies in prosecuting and beinging to a successful conclusion the campaign against the German U-box.

German U-boat
The apparatus may be termed the composite work of
the General Electric Company, Submarine Signal Com-

cable to the operator who was located in the ship s hold A third adaptation of the intening principle was an instrument which protruded through the hull and was a stationary part of the vessels equipment. A somewhat similar device was constructed for use on submarines but aminar across was constructed to use on summarines out all of them were used to advantage. Phonograph records of various sounds heart as early to record of the accomplishment of the decetor. These records were used in training attudents to distinguish between submarine training attudents to distinguish between submarine and surface craft

versally adopted by all the Allied navies

It was found to be much superior in many ways to

any of previous development and come to be considered one of the most effective offensive weapons ever used against the submarine It is only necessary to recount a few pertinent points to illustrate the practicability of

Under ideal conditions with extraneous noises reduced to a manmum or entirely eliminated effective at a range of from 15 to 25 miles average elroumstances, the device was good for a range of between 3 and 8 miles Trained operators could clearly and invariably distinguish between the sounds made by approaching surface traft and underwater vessels (submarines) Within five miles the engine characteristics of different vessels was clearly marked even to the point of identifying by name certain (unseen) vessels after they had been observed previously for more than one time (This test was substantiated by a series of night time experiments at the entrance to Boston harbor in September and October 1917). It was found engines to electrical drive which was necessary every

practical to tell when a submarine changed from her oil time the vessel submerged

While demonstrating the device to the British Admiralty our American engine were asked to study the questi ni of fitting submarine detection units to airplanes, balloons and dirigibles

After some experimenta-tion followed by more prac-tical tests and conferences with the Lancashire Group

Start-9

the direction of sound could usu ally be computed within a very few degrees of its actual location and a good judgment of the distance could generally be made This was proved to the satisfaction of all concerne l following a number of practical tests off Cape Cod Mass in the late ston and m Long Island & While in fairness to all of the sound

detecting devices developed during the war period it must be said that the American device was inferior in certain respects when it came to the application of these devices under tual battle conditions but in heavy sea and weather they stood up re-

pany, Western Electric Company, the National Research Council, assisted and National Research Council, assisted and advised by many eminent scientists engineers and research men, chief among whom were Dri W R Whitney, Irving Langmur and W D Coolidge, Prof R A Militan, Prof Max Mason etc Realising that the prompt solution of the submarine problem was the key to a successful termination of hostilities.

Secretary Daniels, immediately upon our entrance into the conflict appointed a special board to devise ways and

as special boards to development approached a special boards to development of the suggestion of Dr. Whitney a group of seminists was formed at Nahant, Mass, under Dr. Irving Languir, where the results of extensive research activity were put to practical tests under actual conditions as nearly as possible approaching those in European waters as possible approaching those in European waters as possible approaching those in European waters are possible approaching these in European waters are possible approaching the continuous control of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of Out of the efforts of these two groups and the work of the output of the efforts 
The apparatus, finally perfected and put to immediate use, was first designed to hang overboard from naval orait amidship below the water line and it depended for new name and the state time and it depended for its direction getting qualities on the peculiar and services little understood faculty of the human car to detect the direction of sound by the shifting of that sound from one car to the other.

Owing to the interference of sounds made by the listening ship's own motors, it was found more practical

to stop the engines when about to take observations and this added greatly to the effective range of the instrument. To overcome this obstacle, another device was developed which could be strilled off the stern a hundred or so feet away where the engine noises of the ship were out of range and the sound was then brought in by electron.

Attack Unit 10 -Index -· Listening · · Depth Charge -- Base Path of Chasers -- Course of Submorine Chart of an actual pursuit of a U-boat which ended in the destruction of the submarine

of scientists at Harwich, apparatus was developed which met these needs and many aircraft were equipped with sound detectors which rendered it possible for them to follow the course of the enemy after they had seen her submerge a valuable fa ulty which such craft did not possess until the introduction of the American

Permission has not yet been tained to enter into a detailed de scription of the devices invented during this period. The Govern during this period. The Govern using the having spent large sums of money on the apparatus, desires the intricacies of its

manufacture still kept secret, while other matters involv-ing several American concerns makes discretion the better part of valor in attempting to tell the inner secrets of its development

However, when the devices had proved themselves eminently satisfactory after exhaustive experimentation eminency saturations after examinative experimentation here, the Navy Department organized a special Service Party under Capt. R. H. Leigh of the Bureau of Steam Empineering to demonstrate the directors to the British Admiralty Shortly after the arrival of this party

Using the listening device in an American submarine

markably well. This factor was if especial value during operations in the Lightle Channel and the North S which has been termed the roughest body of water for its size in the world

The addition of these listening devices to submarines the addition of these insteams deverse to submarines added the heretofore lacking sense of hearing to all the underwater craft and made them at once a much more effective weapon of offens. An Allied submarine on one occasion chased a German U boat for four hours, while both craft were submerged, without once losing (Continued on page 555)

# Reconstruction in Europe—VI

The Status of the British Railways

By C H Claudy, Foreign Correspondent of the Scientific American in London

MANA Americans who have followed the British MAN Amorieans who have tollowed in british for reconstruction problem closely and who have looked with approving and even cavious eyes on the splendid preparedness for peace which Groat Britain has displayed have been tempted to wonder about the English railroad and its share in the reconstruction

The average American traveling in Ingland has nothing but fun to poke at the linglish railroad. Its engines are little try engines. Its fright cars are coverable with a pocket bandler had an it its passenger cars are little my c than girth I stage coaches. Its cars are little more than girth I stage coacars are little in it. I tail if vinit is take consules to taket system is. I haugh and its baggace system is a crime its stations are in thing like as commodious or as beautiful as the it. I builted Rates and so on from anokostack t. c. il. spike. And now that I ragland is getting rea.] to reconstruct her exconome and her in dustrial system many Americans wonder why she is not also going to make a close sweep in railroads and give the little island a brand new and of course an American

Before going into the subject of the standardisation of British railway equipment as olaborated by the Ministry of Reconstruction it may be well just to glance at one or two things about this toy railroad system that will lesson the intolerant criticism so often levied by the American traveler and make him realize looking back on our infroad muddle as it was in the winter of 1917 18, that the new country may learn something from the old even in railroads

Less than 24 hours after war was declared between Great Britain and Cermany practically the whole rail road system of England Scotland and Wales was operating as a single road controlled by a central rail way executive committee which has the very broadest powers from the government. Not a bad instance of the value of real preparedness—the needful legislation had all been passed years before and had lain quiet dormant

awating the national cinergency
And this is the way it worked Within 10 days the first British army 120 000 inch with complete equip-ment was in France and was well supplied with all it meant was in Franciscus was west experience with an inceded of food and guns and instruit generally. Many years before the war mobilisation procedure had been prepared and as a result of fixed schedules well planned long in advance trains rolled into Southampton every 12 minutes for 16 hours of the day. Any train over twelve minutes late lost its place and would be side-tracked until the whole movement was completed inasmuch as the first movement called for upwards of 1,500 trains it is perhaps not a bad achievement for a 'toy' railroad system to find that not a single one was late and none lost its place in the schedule! One wonders if there is any American railroad which could duplicate that feat from existing plans?

This is not the place to try to tell what the English railways did in the war bow their men volunteered until the government had to put a stop to it how they tore up track to ship to France how they robbed their shops of men to send to dockyards and naval works how they supplied telephones and power, how they took over gaval repair shops and ran them how they kept the artering of ladystrial travel moving even while they rushed goods abroad how they moved troops and served the central military asthority in a thousand ways Effort is made here merely to emphasize the point that regardless of how inefficient and toy like the Inglish railroad appears in American eyes when it came to the point it functioned and functioned will and still does function sixte of the fact that there has been little upkeep and only necessary repair and practically no new ment for four long years

A word as to the why of the little car the small rigine the compartment coach. Figland is a thickly ngine the compartment coach rightness is a thickly populated land. Her villages and tiwns are closed together She can load a string of little goods vans at London and drop them off one by one oach loaded with the freight for some particular town in half the time in which the same task could be accomplished with our huge freight cars which might have to be unloaded at each station keeps g the train waiting. Her traffic at each statuor except clue train waiting ther trains very draws and her trains very numbrous Small savings of time are necessary everywhere. There is no question that a series of compartment coaches can be emptised and filled again a good deal faster than can American conches with doors only at each end. Again the clearance on English railways is less than ours. That means we can have boilers and grates of far larger capacity than can the English engines

England is very nearly a hushed country as far track is concerned She has hardly any grade osungs. To undertake to raise every top crossing of as track is concerned as track is concerned one mis narmy any grown crossings. To undertake to raise every top crossing of every road in England in order to make possible bigger engues to haul bigger cars would be a financial burden which the roads (some 20.000 miles of first class railroads) alone could not stand Even with great government assistance it would mean a staggering burden of taxation upon a people already taxed for war about as much as 14

humanly possible

With these things in mind it should not be difficult to see why the reconstruction programmin regard to railways does not recommend a complete change from existing standards to those found good in America The Finglish roads are not inefficient and they could not stand the cost of a complete change-over even to gain those things in which the American system would be good in Figlish

There is one thing in Ameri an practice which the English railway knows little about and which the English overnment in its Ministry of Reconstruction thinks it hould know a lot about an I that is standardisation About the only thing which is stan lard in Luglish rail ways is gage which is the sum as the American ways is gage winon in the sum as the American Dut noarly everything else is in livelinal Almost all the locomotives built in England for use on English railroads are built by the railroads who homend to use them Therefore each road dougns its own engine and has its own eystem of jigs and templates its own ideas as to of everything, from a coupling pin to a drawbar as result hundreds of repair plants carry thousands suses of everythi of different kinds of parts in st x k and the engine from one road cannot be helped much in the shop of another As the government has found while running all the roads as one this is a matter of vex strous delay and high cost There are on British railways over 200 types of axle boxes over 40 variations in handbrakes and at least two different systems of continuous brakes making it necessary for vaus and wag uns to have two distinct brake systems if they are to run over two different roads!

Again the locomotives thems lyes are of an infinite varioty not of types but of kin is within the types company has had 33 different types of engines and has now standardized on three. Why didn't it do it years ago? But this is a story on the reconstruction to come not on what might have come and didn't

The war has taught both givernment and railroad company that individualiem run riot in a vain effort to up competition and get shead of the rival road, is not a paying policy Individualism in manufacturing has been the cause of Englands I sing many a foreign market on manufactured govis lack of standardised hop practice and parts are what has made it imp for England to have a universal cheap automobile a dollar watch, an efficient typewriter manufactured at

Railroads and government are now at one in the idea that standardisation must be effected on English rail that scandards and in must be elected on English rail roads. The roads want to go slowly because of the lack of material which the war has made difficult to get but they are willing to move. Hence it is that the govern ment in its recommendations seems destined to get some very real and practical results

some very real and practical results

'ummarized these reconstruction recommendations
stand first for the standar lization of wheels acides
whool content, stres running K ar draw g ar buffing
goar bogies brakes and ut it frames under such restrictions as will make it possible for all roads to adopt

strictions as will make it possible for all roads to adopt these standards with as little hardship as possible. British railroads earry too much deadweight. On an eight-ton wagon the tare: 70 per cent of the load as against 40 per cent in other countries. This is ob-viously too much and a fit ground for reconstruction. Hence the Ministry's committee recommends an immediate investigation into gages and clearances into this excessive tare may be reduced by a greater uni

formity in rolling stock

It is proposed to ascertain by independent government accounts what the costs of locomotive construction and rolling stock construction may be as contrasted between private firms and rulway workshops with a view to seeing if some reforms cannot be made in the almost universal practice of letting every road be its own

It is also proposed to bring together for consultation representatives of railroads financed by British capital in foreign lands and the various dominions railroads, and see what they, with the railway experts of Great Britain,

can work out in the way of international standardisation

Finally a definite policy of locomotive standardiza-tion has already been determined upon by the Association of Railway Locomotive Engineers, which has recomof Railway Locomotive Engineers, which has recom-mended two standard types of engines, two kinds, a heavy and a light for each type, to replace the present multiplicity of kinds and types which make the English locomotive so troublesome when it comes to repairs

Nothing very drastic from the American standpoint, and certainly nobling to change much the outward seeming of the toy roads But the little engines and cars have demonstrated that they can "deliver the goods and the English railway organisations have shown as ours in America certainly did not show until some time after the war was well started that national emergency they were distinctly ready. All of which is respectfully submitted for the consideration of those critics over here who are perhaps, a little too or those critics over here who are perhaps, a little too ready to think that a thing which is good in the United States must be good for England It is submitted in defence of the mildest of reconstruction programs—a program which, when the facts are understood, really

## Developments in Making Acid-Resisting Iron

DEVELOPMENTS in the manufacture of acid-reasting iron particularly for chemical plant purposes were discussed before a British Chemical Sognity recently

It had long since been proved in the laboratory the speaker that a pure form of iron could be rendremetant to either sulfuric or nitric acid by the addition of a suitable proportion of silicon, chromium or other elements but the development of such metals upon as industrial and commercial basis was not approached until some twenty years ago. In more recent years the electric furnace had proved a valuable aid in the satis-factory commercial production of such alloys as ferrosilicon and ferroshromium lests made by Kowaike in America had shown that silicon present in a lesser quantity than 12 per cent did not promote satisfactory resistance to corrosion while when it reached 19 per cent or more the acid-resisting quality of the alloy again fell In addition to the difficulties presented by the serious shrinkage of non-corrosive iron castings during cooling, shrinkage of non-correnve iron castings during cooling, which amounted to slightly over M-inch per foot, in each direction as compared with a shrinkage of about 33 22 inches per foot in the case of ordinary cast iron, the presence of graphite in any considerable quantity the presence of graphite in any considerable quantity caused disaster. The iron must also be low in carbon and oppositions otherwise during the process of cooling these compounds tended to esparate out and form these compounds tended to esparate out and form

The following were the physical constants of acid-

The heat transmitting power of acid-resisting iron had been calculated at 10 times that of stoneware or quarts, and thus the parts could be made much smaller A condenser built of acid-reasting iron condensed a charge of nitric acid in 16 hours as against 39 hours with a similar condenser built of pottery With all this success there were etill difficulties to be overcome All alloys there were ctill dimentities to be overcome. All alloys of low-silicon content, say 10 per cent, were attacked very readily by certain acids, and while acid-resisting iron which contained from 16 to 18 per cent, was satisfactory from the viewpoint of resistance to said, it was very hard that it was impossible to machine it in any

other way than by grinding with high-speed abrances.

Apart from chemical apparatus this iron has a wide application for anodes in connection with electrometal-lurgical processes. On the outbrask of the war it was impossible to obtain magnetite anodes, since these were chiefly made in Germany, and a substitute was found in and-resisting iron While the material was not absolutely unacted upon when used for this purpose in copp sulfate solution, many times its original weight of copp could be deposited before the anode showed any serio

# Exploring by Airplane

# Some Opinions on the Possibilities of Winged Exploration Parties of the Near Future

By Eric A. Dime

0 6 1919

CINOE the great world war came to an end, there has beef some speculation as to the new field in which the flying machine may play an important part. The constitution of the control of the properties of the flow of the control of the present of the National Control of the control of the present of the National Control of the control of the present of the National Control of the 
the bringing of man into those unknown region work—the bringing of man into those unknown region of the earth for the study of nature and anumal life. The long range of sustained flight and high attitude, of which our arplanes are capable, should nake these machines extremely valuable to the explorer, the naturalist, and the huster who wander into the wilderness in quest of something that would benufit science and the human

That some of these men are senously consu airplane in exploration work may be known from the fact that Capt Robert A Bartlett, who accompanied Rear-Admiral Peary on his trip to the Pole, has decided scen-admiral reary on his trip to the role, has decided to employ the figure machine on his proposed Roosevelt Memorial Expedition, which he will lead next June to make an aemal survey of the North Pole

Turning our attention to Africa South America and

other countries with unexplored territory, I believe the time is near at hand when expeditions equipped with flying craft will venture into rigious which so far have paret been seen by civilized inan. From interviews I never been seen by civilized man. From intercuess I, shave had recently with man who are familiar with exploration work, I have gained sufficient information to beliave in the practicability of the airplace in this field Of course, there may be aim drawbacks to such a working, the country to be capitally pixed would determine the success of the undertaking. I unthermore, a machinised for the work would necessarily have to be of a design different from the initiary type or the interest used for passenger and commercial purposes. This would be the case in exploring, jumples or deep forests broken by high mountains for which Africa and South America are known.

Carl F Aksley, known as our of the most famous.

America are known
Carl F Akeley, known as one of the most famous
taxidermists and soulptors in the United States, who has
charge of the African Hall in the Museum of Natural
History, Now York, is playing great faith in the airplane for exploration work. Mr Akeley is the inventor of the Akeley Camera, which has been used with excellent results by American photographers near the front line trenches during the war. He is also an explorer and he plans a trip at the end of this ye is to Africa in the interest of science. During a discussion I recently had with Mr Akeley he said that there are still great fields open for exploration, especially in South America, Africa, Madagascar, Asia, New Zealand and islands in the Pacific Ocean The reason why splittle is known about those regions is greatly due to the difficulty of getting into the interior with the ordinary means of travel

Mr Akeley believes that it would be possible to fly Mr Akeiey believes that it would be possible to fly into the country to be explored and locate a suitable landing place. Then it would be a matter of study-ing the country, its natives and animal life in the immediate neighborhood. It would no doubt be better if a group or squadron of planes could make the trip as It might prove too risky for a single machine to set out into the unknown. The explorer-aviator might find it difficult to locate a suitable landing due to der forests but I understand that in some regions like Central Africa there are wid open spaces with short grass that should prove a lead as an amplane's landing starting point

337

During a lecture recently delivered before members of During a lecture recently delivered before members of the Aeronautical Society Mr William Belle of the New York Zoological Society spake on South America and the Airplane He illustrated his speech with lantern slides showing photos of forests taken from airplanes. The pictures were from the battlefields of France but Mr Boebe used them incredy to describe what might be done or South America with an mrcraft camera done in South America with an interest camera. In his leature its add among other things that some interesting sights could be seen by flying over the vast forests of South Amiria. The man who travels out the ground said the lecturer which the crowns of trees in the dones forcests present which the crowns of trees in the dones forcests present such a study of a forest with its bird to the aviator life ought to tempt many an aviator to take a trip that would prove fascinating while at the same time a little risky and dangerous

The arplane should prove a valuable factor in the mapping of a country and this could be done with a mapping camera. The photographer could soar over the gigantic forests and rivers of which we today know little or nothing Every large river and its tributaries in South America could thus be recorded for our geographical records

It might be stated in this connection that a mapping It might be stated in time commention that a suspense caurea designed for arriphants has been invented. It is called the Brock Antomatic (americand is suspended from the fuselage of the machine. It is so pivoted that (Continued in page 186).

## The Canal Street Hudson River Tunnel

To the Editor of the SCIENTIFIC AMERICAN The meeting of the American Society of Civil Engineers held on the evening of the 19th of March, was geneen held on the evening of the 19th of March, was one of the most interesting that the writer has ever attended. The paper presented was by Mr. Austin T. Byrne on the proposed traffic tunnel under the Hudson Biver at Canal Street from Manhattan to Jersey, with coppeal reference to the plan approved by Cen. Go. W. Goethals and on the plan of assertions as proposed by Jone F. O Rouths: the noted foundation expert and

Jno F O Rousk: the noted foundation expert and tunnel builder.

The need of such a tunnel or an equivalent method of carrying the highway traffic from Manhattan across the Hudson, is conceded by all persons and by all engineers that have studied the problem, and I am sure after listening to the discussion of the paper, that all of therepresent at the meeting were not opposed to the building of a tunnel, but as Mr Forgre expressed it, they have their doots about the methods proposed, and, to som extent, about the ventilation of such a bore to carry automobils triffic after it is fuult. There can be no doubt, after the mesterly analysis made by Mr. Byrne have available to carry upon its completion, as to the need for haste in doing something to relieve the traffic barrier than now waits. barrier that now exists

The discussions by Mr Jno V Davies and by Mr se Forgie, the noted tunnel expert, made it very James Forgia, the noted tunnel supert, made at very easer to those that there were many grave problems to be solved, before a tunnel of the magnitude of 48 feet that has been groupsed could be constructed, such as the design of the shield and of the lining. There us no manner of doubt in the wrater's mind but that the shield as proposed by Mr. O'Rourke has many good points, and it would sleam, it a careful sately off it were track to the light of the experience that was gained in the construction of the present Esistica. River and the Thanne Expert tunnels at Lowdon, that a modification of it might preve successful. This can only be determined by a most careful analysis by expert engineers and then by the expenditure of a comparatively large amount of momy in its con-

There was a manufest dismelination on the part of the engineers present to give any red consulting engineering free, and this is manifestly priper is the states can well affort to pay for the most car full missingston of all the points involved and the expenditure of \$100,000 or more for such engineering work will extrainly result in the saving of millions of dollars in usekes expenditure and in some great engineering i put itims that otherwise may go on the rocks

The remarks of Mr Walter ( Parmles who has had large experience in the use of con rate blocks in a smaller but similar tunnel 15,000 feet long it Cleveland under Lake bru makes it apparent it I not all of the trouble has been anticipated in the lesign of the shell of the proposed Hidson River traffer luming and that if the ngn is persisted in trouble will result not only from packing stresses in the conjet in shoving the shield shead but that there is very serious doubt as to the stability of the shell. This confirms the belief of other requirers of experience that I stage will most surely result if the structure is finally I still I have objections again are not beyond the reach of executi study and

analysis. The construction of the present tunnels under the Rudson and of those un't in Inhams showed on-cleared with the varable present of compressed any required at the bottom of the shill define the square and the special state of the state of the special state of the state of the special state of the state of the standard special special standard special spec The construction of the present tunnels under the

until it became certain that electric traction could i

necessfully used. The Mersey and Severa tunnels in Ingland were built for steam traff c but it did not re quire long for them to be changed to electric operation as soon as it was assured of success The Severn tunue it is true was practically 23 000 feet in length and had fans to feet in diameter and 12 feet wide. The Morsey turnel was 8 100 feet long and had a separate turnel drivin alongside of 8 ven feet dismeter for ventilation the fans being 40 by 12 feet and 30 by 10 feet in size This will bring forcibly to the Liv mind the difficulty of ventilating funncls and many other examples might be cited to make more forcible the gravity of this problem in tunnel operation. The recent change of the (ascade tunnel on the (rest Northern Railroad in the (ascade mountains from steam operation to chetric is well

When the question was asked Mr Byrne as mount of automobile traffic in the Blackwall and Rother buthe tunnels under the Thames at London the hist named being 1 465 feet long for the enclosed portion and the latter being only about as short as this his ripls was about 40 per cont. The figures given as probable for the Hudson as derived from the I set River bridge traffic was about 80 percent of the traff cassanto cars or trucks, which is double the figure for the London tubes. You which is conjucture injure for the common turns for its squite sure that the assertions of conjuctures who have carefully made personal investigations of true that it is necessary to shat down the traffic in the I ondon tubes at frequent intervals to all we them to clear of implement and dangerous fumes.

The gas to be dealt with is the deally carbon monorade, which in any considerable amount is titul, and in any amount greater than one part in 2 000 will in time cause those that are brought into constant contact with it to those that are prought into coust in contact with it to contract decasts of the circulatory system such as pneumonia paralysis and interpreteress. This was all pointed out in the Vignet 4th 1917 issue of the SCIENTIFIC AMERICAN in a letter signed. Yow Yorker who, as the writer happens to know his made the most extensive nevestigations into the subject that has been undertaken This study was made for a similar project contemplated by another city. The Scientific Ameri-This study was made for a similar project can at that time commented on this editorially and complianced the need for caution in going aboad with any traffic tunnel such as was contemplated for the Hudson River This was mentioned in the discussion at the meeting of the American Society of Civil Engineers, and attention called to a more recent article in your (Continued in page 458)

# America's Great Effort in Ordnance-I

Supplying Our Two Million Men in France with Artillery, Machine Guns and Rifles

A train of 7-inch naval guns and 12-inch army morters on railway mounts

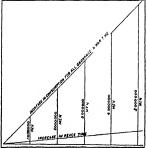

We doubt of many Americans outside the War Department have my conception of the continuous scale upon which our production of ordinance was conceived and carried out in the late war. Indeed, of a twill come with a shock of suppress to the average either to learn how large a proportion of the cost of a war is due to the production of artillery. When the was crossed on November 11th it in he is the hardest National production of the cost of the war is due to the production of artillery. When the was crossed on November 11th it in he is the hardest National production of the control of the control of the control of the control of the cost of the control of the cost of the

### It Is Ordnance That Makes War Costly

Furthermore, it is generally not understood that ordinate melluling rifes, meshing can fit fail daid heavy guns produce and explosives is in itself exceedingly cutty material. A driver vision size in itself exceedingly mately estimate the cost of heavy artiflery on a basis of \$1000 per foun set that of 2 mells "before gun would cost \$70 000 Individe cost \$1000 per foun all may approximate \$3.000 to India must be

added the cost of the gan mount. Moreover, in the whole beld of michanical again, or gitter are few if any constructions which call for wales dutely high grade in all its various branches. Before, a point of material can be fabricated and finished in a country like oursthat is totally imper part of for the waining of war of

Rapid increase in demand for ordnance in wartime

the first magnitude, it is necessary to begin and build everything from the ground up, and the various plants must be of first-class construction and they must be filled with machinery of the saw high quality active gues which they are built to mainful ture. Add to this that material and labor costs we very high when we cortered the war and that they i minuted to rise at an ever thereasing rate, and keep in mind that the propetitis size of our sumy had meen to 5,000,000 men and weval million more than that if it should prove to be necessary and it will be understood why, by November 11th the total amount spent for ordnance was \$5,50,-111,438 is and the total amount appropriated was \$7.75.204.57.1

### Why France and Great Britain Supplied Our Artillers

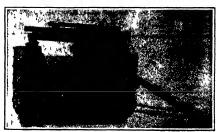

lumediately after our declaration of war, an American immession went to I urope to reducid with our Allies and determine upon a bioach plan of cooperation and asthe result of that conference the following situation developed

Both the British and the I reach had developed their redman e plants to such an extent that they had completely equipped their soveral arms with all the ordinance they could use—that is to say, the supply had overtaken and exceeded the demand. Great British mideed was in the two of hemanding a lorang part of her mustion is latered to the same properties. The same properties the transfer of the same properties to the same and the same properties of the same properties. The same properties the same properties to the point at which they would be sufficient to take care, of replacements I aperionet had demonstrated that when once an army is equipped, the annual explacement of worm and destroyed and captured guias amounts to about 16 per cent of the total equipment, as any, three will be an equivalent addition of 16 per cent for total replacements, as is shown in the accompanying diagram.

diagram in the reports tabled to Washington from brancs by Central Forshing and teneral Blue, they stated that the French and the British, by maintaining their great ordinance factories, would be in a position to equip as Ann rench Aray of a million man with artilley in sax months time. The French offseed to provide us with all the grant we should need 0.75 mm and 105 mm cabler, and the British offseed to supply us with all the heavy calibres Sanch, 9.2-mb, 10-mb, 10-mb, and 12-mb, heavy calibres Sanch, 9.2-mb, 10-mb, and 12-mb, heavy calibres Sanch, 9.2-mb, 10-mb, and 12-mb,

Eight-inch howitzer on caterpiliar mount

A 75 mm. gun mounted on a tractor

both howitzers and guas. They asked us to concentrate on propellants (powder) and high explosives

A great deal of unjust criterian has been directed eigenst the Army Ordnance Department, hased upon the mustaken impression that in ascepting these Fronch and British guns, we were taking material which our Allies needed for themselves. As a matter of fact, we accepted these guns on the armeter representations of our Allies and sile—and the armeter important point—because our using French and British guns yould greatly relave the silepping situation by the contract of the silepping situation in the contraction of the silepping situation in the contraction of the silepping situation is the contraction of the silepping situation in the contraction of the silepping situation of the contraction of the silepping situation of the contraction of contraction of ordnance o

## We Build Heavy Come

In addition to requesting us to concentrate on powder and high explosives, they asked that we should use our

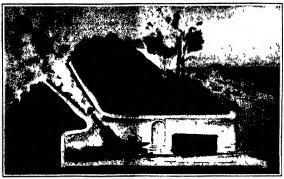

great manufacturing espacity in providing high-velocity long-range guise of large caliber—12 inch, 14 inch and lof-inch, for the bombardment of the back areas of the enemy. To this end we made use of large numbers of our heavy coast defense guisa and of certain very powerful pieces which were on hand in the Navy Department we had a large amount of the artificry built or coming along rangify in production when the war raine to quiete the superior of the production when the superior to the production when the war raine to quiete the superior of the production when the war raine to quiete the superior of the production when the war raine to quiete the superior of the production when the war raine to quiete the superior of the production when the war raine to quiete the superior of the production when the war raine to quiete the superior of the production when the war raine to quiete the production when the productio

# Our Output in New Field Artiflery

During 1917 the enemy still continued to show surprising endurance and striking power and it became increasingly evident that the collapse of Russia was going to release a large number of divisions from the eastern front which would be available as a Catuma reserve for future operations. Consequently and very wisely our Army Ordnanes Department laid down a construction program based upon the possibility that there might be tenance ultimately of an army in I rance of four or hye million men. It would not have been was to rely in definitely upon I reach and British gus and shell plants and it was felt that we ought to cover all future ton by bending every effort to produce a maximum output of new artillery of all calibers and this was done. Huge plants, too many for enumeration here, sprang up all over the country, existing industrial plants were changed over for the construction of artillery, and several enormous plants were planned and construction begun upon them. We took up the manufacture of mortars such as 240-mm trench morters, the three-inch, four inch and six-inch Stokes inorters, we purchased and equipped an entirely new proving ground adequate to equipped an entirely new proving ground acquate to the enormous amount of testing and proving work of all kinds which would become increasingly necessary I has plant, which was located at Aberdeen on the Chesapeake, rapidly grew to be the largest institution of tak ind in the word, and at the signing of the armsities it included a staff of over 300 officers with 4,800 enlisted men Additional proving was done at Carney's Point, Sa vannah Scituate and Erie proving grounds. This highly creditable branch of the work will form the subject of the second chapter of the series in which we shall give the detailed statistics of the guns, and howitzers furnished by our Albes and manufactured in our establishments

# Rifles, Machine Guns and

The Department has every reason to be proud of its watume work in the production of rifes, mechine guns and ammunition I he table showing the total production for France, Great Britain and the United Nitates from April 1st, 1917, to November 11th, 1918, proves that, as compared with our Allies, who had a ranning start, we produced nearly as many rifes as the two nations combined, and were coming along fest with machine

Powerful howitzer, empiaced in a kill, which German airmen could not locate

It is hiped that the above outline of our activities in meeting the ordinance emergency will settle forter in the minds of all to whose attention it may come the conviction that our achievement in ordinance was not only the greatest but one of the most mentorious in the whole range of our constructive operations.

(In be continued)

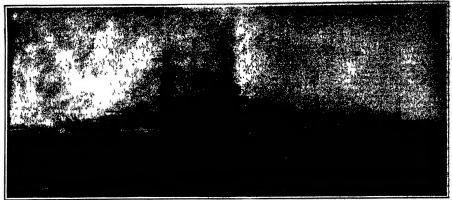

# Construction of Large Motor Vessel in Glasgow

Till British twin series Diesel engined vessel therapp, which has just been built by a Clasgow ship and is according to the local press the largest and most powerful motor vessel in the world. It is of 10 000 tons deadweight, and has two sets of engines constructed by Messrs Harland & Wolff, at their Clasgow works. Hose give a total of 6 000 which figures represent a very marked progress in this tryp of vessel. The engine room auvalances also all deck machinery,

melating the steerin ggear are dictinually diven, the power bring generated by two auxiliary Diesel sets in the eight room A small olfuel loider supplies steam for leating and coding systems and for irre-extinguishing purposss. The oil fuel is carried in double bottoms.

The vessel is designed with four masts three of which act as derrick posts, and the accommodation for officers and crew is on the most up-todate lines, separate messrooms being supplied for science and motormen and separate living rooms for the crew

The "New Mexico" making 21 knots

### U. S. S. "New Mexico"

### A Description of the World's First Electrically Propelled Battleship

### By Henderson B Gregory

PROBABLY no battleship excepting H M S Dreadmought the piones of all big-gain batters and turbine drive has ever exceted more widespread interest and comment than the I S S New Mixio. the first battleship affect to be equipped with electric

Flectrical promision for vessels is not strictly spealing a new idea It has been agitated for some years past both thus country and abroud but it is only quite recently that it has become an accomplished fact L. R. Emmet belongs the credit on this side of the Atlantic while in Europe the Sycuska Turbinfabriks Aktiebolaget Ljungstrom of Swiden has been the prime

After much writing and discussion on the subject of electric propulsion success was achieved in 1911, when the Navy Department awarded a contract to the General Electric Co. in June of that year for electric propelling machiners for the U.S. Collier, dupiter according to designs prepared 18 Mr. Immed. The unqualited success of this installation resulted in the Navy I epart. ment's decision to usuall decrete propulsion in the New Mexico and after further study and investigation of the problem this decision has been extended to cover all capital ships

The New Mexic is me of the three battleships and The You Mexic is me of the three mattesmips uni-torised in 1911 for sister ships I cang the Mississippi and Idaho will are equipped with direct-drive Curbia and Parsons turbums a spectively. The Navy Yard at Brooklyn we selected to built the vessel and the contract for the determination reviews was warded at a cost of \$431 000

at a cost of \$9.11.000 in appearance the N w McCur viry losely re-sembles litt initial at preferencessors as so in by the picture of the vissel. There is one large smoke pape between the two age masts four tracts on the center line—two forward and two at inconting twich vidence. guns and the usual five inch torpedo detense batter is also provided. The vossel is of the following principal characteristics

624 007 97' 11 2" 30' 00" Length over all Breadth, extreme on 1 W 1 Praught, mean, to L W I

Fraught, mean, to L. W. I. 30 '00'.

The propelling machinery consists of two alternating current turbo-quarators spiriting for motors one concetted to each line of shafting the re-being four propelliers. The general arrangement of the engine and motor rooms is shown on pag. [41]. The motors, when devoloping about 29,000 is highly will drive the reseal at her designal speed of 21 knots the corresponding revolutions per minute of the propellers being 166.7.

The generators have two poles ach and the motor stator windings have a switch while can be thrown to give thein 24 or 30 poles, thus providing two prime speed reductions 12 or 18 to one Speed variation with either pole connection is effected by shanging the turbuse speed.

pole connection is effected by changing the turbuse speed of speeds up to about 18 kines on generators is used to drive the four motors, each on the Bepale connection from 15 to 17 kinets, one generator is used on the four motors such on the 24-pole connection from 17 kinets of the 18 kinets for full speed two generators are used such driving two motors on the 24-pole connection.

The main turbines are of the 10-stage horizontal furtistype, designed to develop full power with a steam pressure of 250 pounds agen at the steam chest. A section through the turbines is shown in Fig. 2. The casings are cast from split hor intally and bolted to gether. The steam end heads: i valve chests are of cast ate I, and the exhaust camps are cast iron

cast are t, and the exhaust easings or creation. The rotor shafts are forged sit I and carried by a bearing of the self-shiring typ at each end. The bucket wheels are forged atcel and security keved to the shaft the first stage wheel having two rows of

"New Mexico's" control lawers set for full speed shoul

buckets, all other stages having single rows All buckets are of non-corrowve material

are of non-corrowve material. There are 30 nosters for the first stage, arranged in 19 groups of three nosales each. The steam to each group of nozire is supplied by a separate valve, entirolled by the governor. The nosales of the other stages are east in the disphragma the latter securely held in the turbuse casings and fitted with packing rings at the shaft bureaut steam leskage between stages. A thrust block is provided at the front end of such turbus pust forward of the main bearing. It is of the single collect yet and arranged for ready adjustment, and the stage of 
Lean turnine and generator is connected togetar by a fexible coupling, to insure proper distribution of the load on the four bearings of the set and to take case of any variation in alinement of tubine and generator Naam for each turbine passes through a strainer integral with the throttle valve, throne enters the steam cheek and from the cheat, as determined by load requirements of the cheat, as determined by load requirements.

ments, through one or more of the 10 controlling valves, to the first stage nozzles. The speed control of each unit is by means of a cantrifugal governor mounted vertically on the front end of the turbuse and driven at

vertically on the front end of the turbuse and driven at reduced speed by worm general from the rotor shaft. The main generators are bi-polar, each of 11,460 ke, expectly at 4,240 or 3,000 vide. They are of standard construction with east iron stator frame and core built up of entmelled steel punchings securely fastened by dovetal connections to the stator frame.

dovetad connectors to the stater frame. The greatestor retors are forged steel having radial siots machined in them to receive the rotor windings, which consist of costs of heavy steap respect connected in series, specially insulated for this service with particular regard to protection against dampines. The rotor undrings are secured against sentificing stresses by matsi wedges provided in he siots of the rotor cope ventilating fains are fastened to she end of each rotor for coring are through the generators. The rotors are carried in self-alming bearings.

Two 800-killwatt, shree-wire, direct currents immediately

carried in self-siming bearings. Two 300-kilowate, historium, site of current, ignared turbo-quaerating sets are installed for excisedant of the main units and for driving empire recon suntilares. The turbines for these sets are non-condensing, the exhapst steam from saints being used in the fifth or eighth stages of the main turbines according to the load on the pink units. In addition to the 300-kilowatt excite gets, there are two motor generator boosters through which its vottage delivered to the hand generator held on he yeared to efficiency and tight loads, and date to (similar the temperature). The same constitution accountry when everating. The use of the boosters renders such field warried to self-the without disturbing the vottage delivers of the house of the same of the same of the house of the boosters renders such field warried to the neglow which drive similaries. The state belowed to the neglow which drive similaries.

the property of the control of the c

or dip of rotor decreases and the motor speed approaches that corresponding to the of low resistance, carries more and more of the vireulating current, a small por-tion only being carried by troe only being carried by the outer or high resistance har when up to full speed By means of this construction, using the high resentwinding on starting with special provision to care for expansion, the use of external resostate and col lector range on the motors to provide suitable torque con dinens becomes unne

discons becomes unnecessary.
The weight of the rotor is carried by two self-chining bearings supplied with oil from the mean lubricating system. Ventilating fans are fitted at each end

The alternating current switching arrangement com prises in general two eight-pole double throw generator descended and voltage charging switches four eightpuls magie throw motor dispois spage throw motor dis-connecting swith hes all hand operated at place, one bus tie switch, operated from within the switchboard cag: within the switchboard cage two three-pole double throw reversing oil switches and two six-pole double throw pole changing oil switches perated from working platform by the four large levers shown on the opposite page and the field switches, controlled from working platform hy two small outside locome tive lates levers as shown

### Agricultural Labor to Cure Cripples

SCIENTIFIC officiency is poculiarly triumphant when two important objects can be made so to dovotall into each other that a single operation accomplishes the attainment of both a fact realised by our remote an costors when they coined the phrase killing two birds cestors when they coined the phrase guing two birds with one stone. A very striking example of this cornes to hand in a report I ut before the I rench Academy of Scences not long wil as to the remarkable efficacy in restoring wounds I not a suffering from the secondary results of their inpurs to the use of their limbs.

The sequellar as they are termed of serious wounds are various and all mir or less disabling even per manently if special care be not taken to relieve them They include not only the stiffness of the points which is always an attendant of prolonged issue oven where the joint itself remains uninjured but swellings adhesions joint itself remains uniquired but wellings adhenous lank of musuals and nevous per we suffined on me some tissue et al. the he has been to the second tissue et al. the he has been to the second plant of the wound teeff and it would be second plant of the wound teeff and it would be second plant of the world teeff and it would be second to the second tissue that the second tissue that the second tissue that the second tissue the second tissue that the sec to secure the mechanical repetition of the p movements

The applications of water, heat and electricity as curative agents are highly valuable in special cases both as to the local reactions obtained and the stimulus to the eral health house in many instances they are pracsecretary induspensable As far as concerns the medianical exercises however whether as individual gymnastics or as mechanotherapy involving more or less complicated apparatus it has the marked disadvantages of being very expensive of being conducted indoors of being necessaexpensive of one or two hours per day where the number of patients u large and most of all of being so uninterest-ing to the patient as to produce a lessitude and ennu-which are generally unfavorable to the patient s wifare

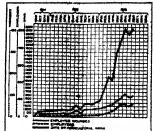

These considerations led the physician who presented the report to substitute agricultural labor as a restora tive treatment for the said sequellas of wounds. The experiment which began in October 1914 on the tract of land called La Solitude at Martillac in the canton o La Bride a hospital annex containing 125 beds had continued for 30 months when the report was presented to the Academy on April 2d 1917 and had met with the to the Anademy on April 2d 1917 and had met with the most remarkable success, partrularly in the case of patients who had been previously accustomed to agricultural labor. The implements employed were merely the usual simple tools used for farm work the hos, the spade the rake the plow the wheelbarrow and so forth but it was found that these could be made to supply, singly or in combination every possible stitling or form of exercise required for the restoration of function.

The obvious advantages spring not only from the surroundings of fresh air and more plentiful sunlight, but from the fact that the prescribed excresses continue over 1700 use fact use the prescribed extrates continue for many hours daily instead of one or two and this without over-fatigue aince there is no constant appeal to the attention the movements depending largely on the reflex system which is physiologically almost inac cosmile to fatigue

The greatest benefit of all perhaps is due to the continuous pleasurable interest arising from the achieve that normal delight

continuus pleasurable interest armsu from the ment of tangbie imprisonal results that norms in productave work felt by all healthy indi-viduals I is of course requisite that eso-patient should have the nature and amount of his work carefully inversibled by a competent physician who must see that the labor involves the required motion of the part affected prothe required motion of the part affected pro-portion the effort to the strength and fix the hours of labor. He must also see that the patient down not substitute short cuts by tening other muscles. Thus a man with a stiff right arm might get more work dome by using his left arm but the real purpose of his labor would thus be folled. The director thus sums up the benefits accruing
The result of this truly physiological form

of therapeutics of this functional resducation, have been most satisfactory set for the wounded men both physically and as regards their morale for the country from both the military and the economic point of view As to morale the entire mental outlook of a hospital patient the entre mental outlook of a hospital patient is changed by work in the fields. Physically his general health and his cardiac and pulmonary functioning keep pace with the rapid decrease of the local disability. From the multiary outlook 80 to 90 per cent of the men have been restored to service. Finally an economic gain in achieved by the very sounderable amount of supplementary farm labor thus secured.

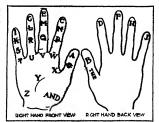

Curves showing extent to which France gave her wounded agricultural employment

Subjoined is a diagrammatic curve showing at a glance the number of days of agricultural labor obtained by the institution at Martillac This came to 30,000 working days furmished to agriculturists in the two cantons of

### A Talking Glove for the Blind-Deaf

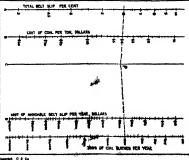

Fit is a problem to keep a blind person in close touch with the world about him what shall we say of the difficulties of communicating with one who is at once

Talking glove for the blind-deaf, which makes it possible to carry on a touch conversation

blind and deaf? Yet such persons are always to be found bune and dear: we stank persons are aways to be touch here and these, and they are communicated with after a fashion. Helen Keller and others have been able to read thes with their fingers, and in a recent actiole in these pages a deaf-blind girl was mentioned whose associates converse with her by "writing out their words, in ordinary service and a letter at a time on her palm

For some years as a result of the war we may expect to have among us rather more than usual of those doubly afflicted unfortunates. Accordingly it may not be out

This chart beats a slide-rule for finding the cost of belt-alluness

of order to draw assemblem to the farther seguingual by a Communicat Yashee, Dr. Walliam Navy of Amelian has most his swar amply! approaching blushees and district answer. Dr. Terry's "tabling glove" is not new in in his new to the swar of the state of the word by means of an Aphabet Jonalised on the Jonales of the finger, and it has been suggested that the scheme is wastly older than even this. Past Dr. Terry a layout in perhaps as satisfactory a one is could be employed, and it makes provision for all the letters of the present English alphabet, which is not the new with all of its professors. And Dr. Terry at least some with all of its professors. And Dr. Terry at least for this to talk with total strangers who were not acquainted with his system. This feature community has present this feature community in the state of the processors. for nim to task with total attraggers who were not ac-quanted with his system. This feature consists in a thin giove, marked with the letters in the locations which had been assigned them. When the doctor had made a new acquantance, all he had to do was to draw its this giove, and he was at once acquipped for converseigns

### Steel for Guns

Steel for Guns

Time metallury of gun steel has been greatly sitered as a result of the war. This is particularly lens in this country and is probably more or less so in Essjand of France at the war dever to a close, steel for large guns was being mode in a radically deferent manner than the country than the country that is an asseption of the country than the country that is a seepled fact four years ago or less that only and speak-march as of country that the country that is a seepled fact four years ago or less that only and speak-march steel outside to a safety incorporated in ordnance guns. The plants especially built in this country early siter our entrance into the war, adopted this process. The reason for this policy was that it as possible to make the policy was that it is possible to make the policy was that it is possible to make the produce a best of the policy was that it is possible to make advantage involved, however, is the length of time to produce a best of such seed it all such work the complete decondation, the formation of the proper sings, and the refinement of the most consume from its to 15 hours in the case of a 40-or 50-ton heat with the utenest care accountry. As the development of the confiamous program of the United States progressed it was found beauch bottom, could and this produce gun reside round, if not superior to that made by the long-drawn-out acid once-hearth process

neade postoris, cettur and tid produce guz sress equas, in not superior to that made by the hing-disam-nost and open-hearth process. While a 8-per-cent nickel etsel was the standard alloy incorporated in many of the guss, it is stated that at one of the large British plants a plain cashoo that at one of the large prisons plants a plant andexnon electron steel was giving entire satisfaction in the last months of the war. An interesting report, also, is to the effect that mone American plant gun seed that me ordnance specifications satisfactorily was being made in basic open-hearth furnaces—a steel that was taboosd for guns before the war and later.

for guns before the war and later
It is probably a fact this had the war continued much
longer the electric furnace would have been the first
electric furnace would have been the first
it was even being scheduled for one of the later pleate
it was even being scheduled for one of the later pleate
and thus use, not so much perhaps because of the stope
onty in quality over and open-inerth, but because the
same amount of suitable metal on ab e made is about onethird the time In prosecuting a war, time counts

### The Cost of Slipping Belts

THE graphte computer, which enables us to lay a ruler across a group of scales on which our navanage

data are laid out and to read then the answer from the ruler a intersection with another scale,

from the reler a intersection with another easi, as now a familiar freast. We have shown several examples in those solumas, and may perhaps be foreynen if we show another. As appreciable items of preventable factory waste is belt slip. But until he known just how much his belt slip is sorting him a manufacturer can hardly go very far toward as prevention, for these is no gain in appendiculation for these is no gain in appendiculation for these is no gain in appendiculation for these is not gain in appendiculation for the second of the second ower engineer

in a power engineer. If the total persontage of belt fifth to the II the total persontage of belt fifth the marked or like A and the average price pied for coal on line B, there will be determined a peint. P on line C. If this point P be them jugued with the proper point of line E, on which is pletted the annual coal consumption, it will cut line D at a point indicating the agginal coat of the belt sip nuisance. Our figure aftern the problem worked out for a page entirely from air per cert slip, and burning 1,000 were of coal per years at 84 per ton. The coat of the belt slip is here men to be no less this all 00 per assum, in guite of the rettiee mindi assile of operations inclinated by the low fuel

### ing Freight Care of Concrete

CONCENTE is rapidly becoming a castverest statemal Bach day, so the same that the same but one that promises to be far

The beginning of practical plans for the manufacture of reinforced concrete freight cars dates from 1909 when a patent for such a car was granted to Joseph B Strauss of Chrosgo On account of the war, con of Chrosgo On account of the war, con struction of a trial car was delayed and it was but recently that the first car of the was our recently state the irst car of the gondola type, was complated by a Chicago company and tasted under service con-ditions. Not only in the material used but in its design and the details of construction, it represents an interesting de-parture from usual methods

The basic feature of the dougn is a steel on body forming the outer boundary othe car, and mounted upon a steel under-frame. The concrete walk and floor are contained within this frame and together with the frame and floor reinforcement are comand interlooked with the underframe. The steel frame forms the finishing and protective edges thus entirely shielding the concrete and also serving as a complete

shielding the concrete and also serving as a complete system of stress-bearing members the comment gun In the construction of the test car the comment gun was used. The forms were placed on the outside of the sar, and the comment was shot against them from within The outside of the car that is the surface against the forms, was given a smooth finish but the interior was left much as it came from the gun Tests of the completed on; both empty and loaded the contraction of the contractions. In the

Tests of the completed ear, both empty and loaded demonstrated its practicability for rough service. In the test without load it withstood extremely rough handling in switching, and came through without nigury "ub-sequently, she car was loaded with 55 tons (10 per cast overloads) of and and turned over to a switching crew for service handling. It withstood this test also without

for service handling. It withstood this test also without injury.

Other meeties actioned for the concrete one. It will not seed patients and will protectically eliminate maintaneauce changes. Re life will be much longer than that of the receive one car. It will knew the important advantage, able, of bang unaffected by the cargo, and will assessmently be estipated botter than the wheel car for successmently her estipated botter than the wheel car for form the second of the

### Rustless Steel Invention

THE romance of rustless steel one of the most recent metallurgical triumphs is given increased prominence with the removal of control. The new metal with a THE romance of rustless steel one of the most recent bright surface and able to resist the corroding effect of air water and soids without staining was discovered just prior to the outbreak of the war and was immedi ately commandeered by the British Government for use in airplane construction and for purposes where strength and durability, combined with rust resisting qualities were invaluable The steel is a Shefileid invention, and was chanced upon largely by accident A local metal lurgist Mr Harry Brearly author of numerous standard works was experimenting in the armament shop to find works was experimenting in the armainent snop to muo a means of preventing crossion in gin tubes. After some of his experimenta is noticed that cartains pasces of chromic stell had not suffered from contravey influences under conditions which would have rusted ordinary stell under conditions which would have rusted grammary sice! He followed up this elue and what is known as stanless steel was eventually worked out and added to Sheffield s metallurgical triumphs. It was applied to manufactur ing outlery

### Kiln Drying Oak for Vehicles

ONT of the distinct developments of experiments conducted at the Forest Products Laboratory at Madison Wis during the war was a rapid method of sessoning oak

It requires from two to three years to air season heavier oak wagon stock Better stock has been accured by drying this heavy green oak according to Forest Service recommendations and the

time for d-inch material green from the saw is reduced to 90 or 100 days

Three large plants using this system have negligible losses as compared with losses at plants using other meth ods which range from 10 per cent up to complete loss Where there were heavy dry ing losses there was heavy pressure for relaxation in in spection so that poor drying meant not only an excessive loss of stock and a holding on deliveries but prob ably also prorer material in

Wagone One furniture plant with orders for spare parts that followed improper drying methods is reported to have inst \$25 000 worth of stock on one run stock which was being depended upon to keep the force at work

# Servant to the Peoples of the Globe

THE progress of the peoples of the world has followed the spread of machinery around the globe

Machinery frees men's bodies from irksome tasks. Their minds then turn to larger thoughts and larger usefulness. Producing power expands. Life itself grows more abundant.

But machinery cannot make its way without correct oils and efficient lubrication service.

To enable the machinery of the world to develop its highest efficiency, the Vacuum Oil Company has provided both the correct oils and the scientific service.

Correct AUTOMOBILE LUBRICATION

**NEW YORK, U.S.A** 

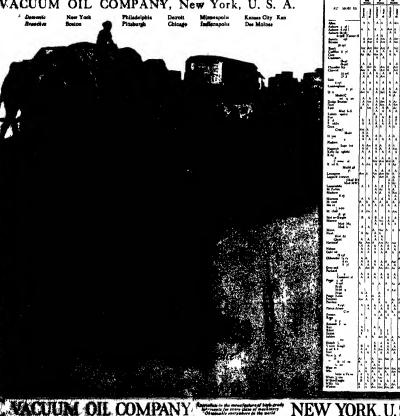

Today, Vacuum Oil Company branches dot the earth From these branches men familiar with scientific lubrication serve each nation's users of machinery. Power engineers the world over have come to look to the Vacuum Oil Company for advice. At all ports of importance, stocks of Gargoyle Lubricants are held ready for every lubricating need.

in rendering such service, the Vacuum Oil Company has become a sement to the peoples of the globe. As conditions demand, this service will be extended. As new lubricating needs arise, they will be met.

The work must go on.

## Inventions New and Interesting

A Department Devoted to Proneer Work in the Arts

### An Ironing Machine for Wire Rolls

I N working with roll wire reinforcing In working with roll wire reinforcing the concrete contractor has un doubtedly experienced a good deal f difficulty in keeping the material fit and straight. It is a good deal if the six sort of game as handling photographs which have spent simil days roll it is mailing tube with the special aggravation assured by the broches. caused by the breaking or bucking of single strands or mishes. To straighten out a badly twisted rell by hard in vives a great deal of time and some very distantoful work

We illustrate a handy little device that ta'ces 'his unpleasant jeb out of the work-man's hands and does it for him. I he and of the reinforcing roll is inserted between the two rollers and the wire is pressed out smooth and flat in its passage between them just as clothes come out of a wringer in a state of complete flatness It will be noted that the rollers are provided with adjustable bearings so that more or less pressure may be applied,

### A Speaking Tube for Airmen

COMMUNICATION between passengers in an airplano is a necessity especially in instructional and military work. Because of the roar of the engine work Because of the roar of the engine and rush of wind convorsation in the usual sense of the word is interly impossible and telephonic or other signaling systems must be resorted to Of late there has been introduced a most ample means of communication in the form of a special speaking tube which is the subject of the accompanying illustra

tion

The airman's speaking tube is the invention of B F Missaner a well-known radio engineer of New York (try I the at once simple light, confortable efficient, and comparatively inexpensive It weighs less than three pounds It employs neither delicate net hansins batteries, nor electrical connections so Datteries, nor electrical connections so that there is nothing which can get out of order. Being built into excellent and popular types of soft leather helimets and possessing earpiects of the list design this speaking tube arrangement on he worn for hours without disc unfort

The Missaner speaking tube has been successfully tested on various types of aircraft, including the most powerfully motored airplanes. In use the holmet should fit snugly so that an airtight con tact will be made between the ear necessity of undue tightening of the chin straps. This is very essential in order to keep out interfering noises and prevent wind rush is very important especially in high-speed machines. This applies both to listener and to the speake the listeners head is in the air stream the wind friction develops a powerful roar which makes hearing difficult if the speaker s mouthpiece is in the air stream the air rush will set up interfering noises in the tube that will also make hearing difficult The windshields ordinarily provided give the necessary protection speaking the mouthpiece should be held close to but not tightly against the mouth if held tightly against the mouth he and law movements are interfered with and also the voice sounds are muffled A moderate voice intensity gives best rosults even though the speaker cannot hear his own voice A moment s testing when starting a flight with low medium and strong voice intensity will quickly and at which is the best procedure As will be noted in the illustration, the speaking tube affords but one-way communication. For two-way communicitim two sets of speaking tubes and belimpts are meet

This simple speaking tube arrangement permits of carrying on a conversation in any airplane

Taking the kinks out of reinforcing wire

A machine that prints circ complete, with address and signature

### A Universal Printing Machine

THI filled-in circular letter is an old-time friend. How many times do we ind it in our mail with name and address staring at us in violet from the

top of a bright blue selling story! On perhaps the contrast is between blacks a sickly thing that looks as though it might anothy thing that looks as though it mides once have been a gray, and a brilliairy not black or shiny blue-black, trying to to last the thing one from his same source. Sometimes the pathetic effect to make good the deception of a personal letter, to us slone of all the millions, is distributed by the standing an eighth of an inch above or below its at single special property of the letter has been above to below its at single special property of the letter knows by heart the difficulty of making likes make the distributed on the standard of the section of

this problem. He knows that nobody is going to pay the same attention to the opening paragraph of a self-convicted circular as to the same section of what might, on appearances alone, he a regular letter, and be know only too well that that first paragraph is the one with the knok, the one that must "go over" if the entire letter is not to fall fait—and fall flat on its faces in the water. -and fall flat on its face in the waste-

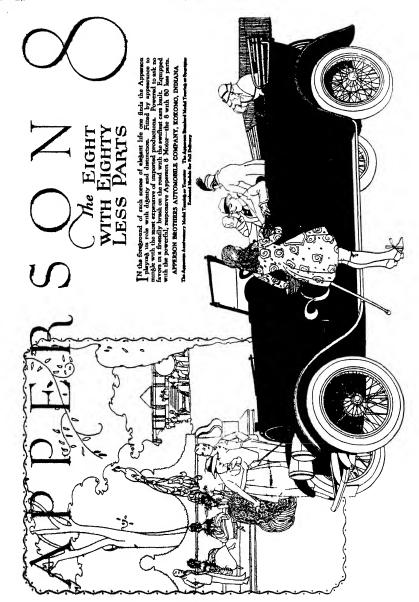

ne 10 years ago Mr E E Strawn of Some 10 years ago Mr E E Stearm of Des Moines began working on a machine for process letters that weedf not go attright to the jude-man; and this select to improve the appearance of the fill-the has been the idea belief and its more than a work which the best had been the fill the resulting the selection of the fill-the had been the selection of the fill-the had been added, of their we have here really a new the selection of the fill-the had been added, of their we have here really a new the selection of the fill the selection of the selection

was archable slow of mechanism.

With this mechan a letter in printed in one solor, a different name and underse in printed on such letter in the same solor, and in séculial si se since a letterbad di wassed) and a signister an interchad di wassed; and a signister and pranted at the same operation, in the same of the same such as the same of 5000 letters per hour.

To do thus of course the machine uses paper in rolls: This in itself means a great saving in the buying of supplies are assuing in the supplies, which in this respect the machine practically duplicates various others which we have seen The entered the same since one as a time, and discharged hack into an inserechangualist drawer in the patter is advanced from the sall il inches at a stam, this beging the largish of the letter preduced. While the paper is at a stational till his body of the letter is guished from a comprise of supresse guine sur une up on a sight bud mish a correspondent of types

shed ribbon between it and the typic and the every appearance of a kype written letter is biblished—in fact, we get a letter that is truly typowytens though by michina hit the same open-ties a name plate is breught into pertian; and ame and address are printed, along with the body of the letter, through the same ribbon Of outures is maches—how on it help nearching? Aid by the panel tolkin, unless these occurs dome in

BESSEWICK OIL ENGINES

worm; but it has been done. In one district of the Seychelles Islands for instance, every one of the 740 houses now has an approved latrine, though only seven were so equipped when the work began The suggestion that this statement reto European residents can easily be des posed of by cling the lact that for in entire archipelago the white population is but 600 And what has been done in Seychelles has been done—in small areas to be sure but none the less effectively for those areas—in the West Indes, in Sum in Costa Rica and Niearagua, in our own southern states Perhaps in the last named locality the problems of the workers were as acute as anywhere, boestuse here there was to be combatted not alone popular ignorance and indifference but actual hostility against interference with those areas—in the West Indies, in Siam actual hostility against interference with the liberty of the individual. Yet in 66 of the 300 communities in the South where this sort of work was conducted within a certain period not a home was left without an approved latrine the percentage of houses so equipped before the campaign was, for these communities 76

So much for prevention In addition it may be news to a good many of our readers that a specific cure for hookworm has been that a specine cure for nookworm has been in use for several years. The campaign against the post has had more or less publicity but we do not recall that this particular aspect of the case has as yet n touched upon in any save medical been touched upon in any save medical publications. The facts are, really, some what amusing The worm occupies the intestine the logical remedy is therefor to cause the patient to evacuate his un welcome guests. But the worms are so firmly attached to the walls of the intestine

firmly attached to the walls of the intestine that they resent with great success the action of ordinary supratives. In this dilemma it occurred to the Rockefeller institute a searchers that if the worms could only be paralysed, they would lose their grip and be passed sauly enough. Two drugs were found which have this happy effect upon the parasites while at the same time producing parasites while at the same time producing no serious results in the case of a patien who was suffering from no organic weak ness aside from the direct ravages of hi hookworms So the program of treatment consists of a dose of thymol or of chenopodium-just now the latter is preferred-to reduce the worms to helplessness, followed by castor oil or some other purgative One treatment is seldom completely effective but the most virulent cases have yielded to three or four, at appropriate intervals In fact based on the proportion of worms harbored to worms removed, a single treatment of chenopodium is found to have an off ciency of 96 per cent

With sufficient time and sufficient funds and sufficient workers, it is accordingly well within the possibilities that the Inter-national Health Board which is conducting the anti hookworm work, will succeed in the practical eradication of this long-standing menace What such success will mean to the world is suggested by the estimate of an engineer who places the discovery of this transment second on the list of benefits to the human race which have been contributed by individual members thereof since the dawn of time

# The Value of Suggestion

In a recent interference proceeding involving five separate applicants for a patent, three of them attributed their conception of the invention to an illustrated article abpearing in the SCIENTIFIC AMERI-CAN. By placing before your engineers, designers and mechanics for systematic study, copies of patents, you may stir their inventive faculties to your great advantage.

We can furnish complete sets of United States Patents -- properly classified -- relating to your particular line of work in convenient form for ready reference. Write our Manufacturers Service Department.

### SCIENTIFIC AMERICAN

U-hoat to be, drupped a pastern of depth bombs and then withdrew to take observa-

Peverish activity and the sound of hammers ringing against the ship's side was heard. The submanne motors would then start up and stop, start and stop

Further attacks were delivered and mor noise came to the inteners from the hold of the submarine Evidently the first depth charge had taken good effect and depth charge had taken good effect and the enemy a crew was making a last deeper-ate effort to reach the surface. Then there was a diad sleene broken at last by 23 sharp reports like revolvers shots. The crew, giving up in deepair, had committed suided. The lose of this submarine was later substantiated by the British Intelli-sace. Description.

When Capt Leigh and his party went abroad in November, 1917, he requested the Admiralty to loan him two high speed the English waters but was finally obliged to accept 3 trawlers of 9 to 10 knots speed, of the scarcity of higher speed craft at that time

Equipping these vessels with all of the anti-out marine detecting apparatus, they went out in the Laglash Chainnel on New Years Day 1918. Shortly afterwards a wireless: cessage was picked up from an airable groung the position of a submarine which had just been seen to submerge The Clant Chad been laid out in numbered squares t facilitate the immediate location enemy craft and the little squadron steamed ver got their devices out and picked up the submarine s course

When believing themselves about over the enemy depth bombs were discharged and later a trawling instrument was used which it di uted that the submarine had been destryed. Great quantities of oil e of the attack

Remaining in I nglish and French waters for several months where the American devices proved of great value and were highly complemented both by Admira Sims and British Naval Officers another squadron was equipped and sent into the Mediterranean and Adnatic where at this time submarine activity was at its

The Barrage Acress the Straits of Ot Because of the deeper water and less interference from surface traffic listening conditions were unusually good. A bar-rage line of boats was organised across

ato Straits between the mainland and the Island of Corfu to put an effective stop to the enemy s free entrance to the Medi terraneau

The Corman submarines leaving Pola rere abliged to go through Otranto Straits to get to the Mediterranean and once through they had things practically their two way as there were very few patrol boats in the Mediterranean. The tonnage mk during the first three years of the war hows the condition that existed before the

Otranto barrage was put into effect
Our submarine chasers while on barrage were constantly in sound contact with emy submarines especially at night, as enemy submarines especially at hight, as they usually attempted to get through during the dark hours. They would run down on the surface at their maximum speed an! suld be heard for an hour or two before they came to our line. The dif-ference of sound between an oil engine and an electric motor is so marked that it was comparatively easy to tell when they chaiged from one to the other which was necessary as soon as they submerged As they knew approximately where our line was they invariably submerged two or three miles before they reached the linear

makes before they reached the larger. The course of the submarine was plotted to stable by the flagship of a unit from bearing large given to its from the other two heatest and also from its own bearings when the submarines had also from its own bearings when the submarines had approached sufficiently industry along the bearings when the submarines had approached sufficiently industry along these lines; wheat the submarines had approached sufficiently and manufacturers ours to the submarines of the submarines and the submarines are submarined to the submarines and the submarines and the submarines are submarines and the submarines and the submarines are submarines are submarines and the submarines are submarines and the submarines are submarines and the submarines are submarines are submarines are submarines and the submarines are submarines are submarines are submarines are submarines and the submarine

Three of the chase tion abreast one dark a marine approaching. I tained by the two beas directly toward the o directly toward the middle boat now he approaching from a pos The enemy came neares finally passed right under the av a wave of water along the

When the German had pas out in front, the attack was made in an a pattern of depth bombs was "that and the little fleet halted for further" vations Pretty soon the whir? submarine s electric motors, was evidently in an effort to rea surface

Then came a crunching noise not w the popping in of a blown up paper-bag
It was apparent that the submarine had been damaged, put out of control, sunk and that she had collapsed nunk and that she had collapsed from the tremendous water pressure at these depths

Many merdents of this kind occurred during the subsequent operations in foreign during the subsequent operations in foreign waters and several submarines were ac-counted for through the direct aid of the American lutening devices

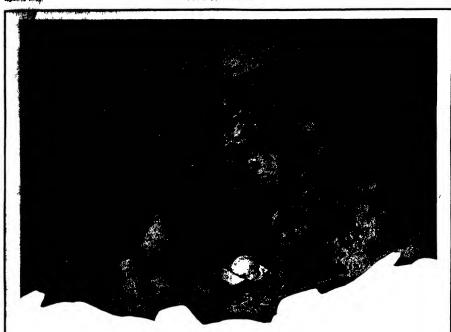

In fact, naval experts who a in touch with submarine detection designent during the war period, etate, conviction that if the conflict that timued through another summer, the sufmarine would literally have been driven from the ocean the promuse of a condit due in a large measure to the perfection o submarine detecting apparatu

It has also been stated that the notice able change in naval tactics—from defe ave to offensive—which marked this; country a surfame into the war was largely; caused by the application of American principles to the pursuit and attack of the U boat something made possible by the practical use to which it was found the American submarine detector could be put.

### Foreign Trade in Furniture

EVERAL phases of the war and peace-time activities of the Forest Products Laboratory at Madison, Was, have a bearing on the problems of shippings furniture overtean These cover the con-ditioning or preparation of the wood to sud-the climate to which the furniture will be the climate to which the lumiture will be east the use of waterproof glues, kiln drying, boxing and crating for overseas shipments, and possible treatments to prevent depredations of wood destroying insects. While information is at hand on general principles, the application of these principles to the needs of the furnitus industry has never been studied, and can not be undertaken without the cooperation

In general it can be stated that furniture manufactured in the north central states will check and open up when sent to desert regions, and that its wood will swell, the regions, and that its wood will swell, the glue joints open up, and the veneering come off when it is sent to trapical humid regions. Exact knowledge of the climatic conditions surrounding the use of the furniture at its destanation and a reproduction of these conditions in the factory through the control of humidity in works rooms, should offer the ruccessful solution of this problem. This would be coupled with consideration of drying the lu the proper mousture content, and shipment in moisture-proof packages to insure

# The Finger in the Dike

WHEN a whole countryside was menaced by a great disaster a frail human finger saved thousands of lives and mill ons in property. People went about their daily affairs never dreaming of the impending catastrophe or of the tmy finger that averted it

Today milions of people work and play and sleep and est totally unconscious that fin gers in the dike are serving them and protecting them in every waking and sleeping moment.

The trolley or train that carries you to your daily occupation would stop dead were it not for the rugiant fingers in the disk back at the power house—stopping the leaks by keeping the joints tight and making possible the manufacture of power

Fatal railway accidents would be frequent but for the fingers in the dike that keep the air pumps tight so that the air brakes will in stantly respond The elevator which lifts you to your office would not respond to the control of the oper ator if the fingers in the dike were not keep ing the plungers packed tight

Electric lights would fail water in kitchen and bathroom faucets in fire hydrants would not flow it somewhere the finger in the dike failed to serve

You never give a thought to these silent and hidden fingers in the dike

They are Packings rubber packings UNITED STATES PACKINGS Packings that make joi to water tight or steam tight or air tight Pak kings that make possible modern POWER the keystone of civilization

There is an appropriate United States Packing for every need. There is a United States Findineering service (fire of all charge) that puts every plant on a standardized basis so as to apply the right packing to the right place in the right way.

**United States Rubber Company** 

### WILLIAMS' SUPERIOR DROP-FORGINGS AND DROP-FORGED TOOLS

In every line of human endeavor there is always one name that stands out preeminently never as the result of ac-cident or chance but of years of conscientious effort

J. H. Willsams & Co., for nearly half a century has stoodfor SUPERIOR DROP FORGINGS and DROP FORGED TOOLS the best that years of experience, the employment of the most expert technical skill, adequate modern equipment and progressive methods have made possible

Our two complete plants, at Brooklyn and Buffalo N Y serving Eastern and Western territory respectively insure quick delivery and reduce transportation delays to a minimum

We carry regularly in stock many complete lines of Machinists Tools including 40 standard patterns of WRENCHES in about 1 000 sizes with openings from to 75% inches

### MINISTRIES DU PONT AMERICAN INDUSTRIES EN LES

### The Greatest Chemical Industry In America

In 1802 the Du Pont Company made its entry into the chemical industry as manufacturers of explosives. Since then, with our entry into related lines—Py-ra lin, pyroxylin and coal tar chemicals, Fabrikoid paints pigments, acids and synthetic dyestiffs—our chemicals interests have grown until today in the Du Pont American Industries there has developed the greatest chemical organization in America.

At the present time 1200 graduate chemists or about ten per cent of the total number in the United States are employed by the various Du Pont companies Four great research laboratories operated by the companys

Chemical Department employing in the neighborhood of four hundred technically trained men are maintained by our com pany to carry on experimental operations for the improvement of existing processes to find the means of utilizing our by prod-ucts and the most economical raw materials and to develop new products

For work of this character two million dollars will be ap this year by the Du Pont Company exclusive of capital expenditures for buildings and equipment
Thirty analytical laboratories are operated by our companies

in the testing of raw materials and intermediates to control the quality of our finished products

A large corps of chemical engineers supervise the manufacture of silvents Pyra lin acids explosives dyeatuffs etc and promote the maximum chemical efficiency in the operation of

In the world reconstruction era, this broad American chemical industry will play an important part

The same logical reasons that led to its present diversified

ctivities point to further expansions into other related fields of industrial changatry

E. I. duPont de Nemoure & Co. ed 1802 Wilminston Delewers

### Exploring by Airplane (Continued from page \$87)

nt holds a level position regardless of the swaving or pitching of the plane. The exposures are made automatically, the number per minute being regulated by a gage The instrument is operated by a spring, which is wound by hand The camera holds a roll. The instrument is operated by a clockwork driven by a spring, which is wound by hand The camers holds a roll of 100 films laken in succession, as the plane files the photos would reveal a panorama of territory nearly 50 miles long that is if the exposures were made at an average height of 8 000 feet. From this it is obvious that rivers could be mapped with a great deal of accuracy

When our late African explorers such When our late African explorers such as Invingstone, Stanley and Roosevelt went into the Dark Continent to study the flora and the fauna and to bag big game nors and the tauna and to bag big game they had serious obstacles to contend with in the way of transportation. Progress was slow and the greater part of the travels was made on foot. There were long caravans of natives carrying supplies, etc., but even these could not reach all parts of the vast jungle, where danger lurked on every ade Airplanes were unknown quantities in those days and if some one at that time had mentioned the possible use of a flying machine for exploration work he might have been dubbed a dreamer of the wildest sort But times have changed and it is my firm conviction that in the near future we will find the naturalist hunter soaring over the jungles of the wild country and with either a rifle or a machine gun

bag his elephants from the air I hat this is no idle speculation but a that this is no idle speculation but a perfect possibility I gained from Mr Charles Cottar formerly of Oklahoma but lately of Nairobi, British East Africa He went to Africa in 1910 and muce ther has ice ome quite familiar with the jungle where he went big game hunting. Since made three trips back to the United States maid three trips back to the United States to beau supplies Mr Cottar did not let the war go through without seeing service. He was a houtenant in the In telligence Section of the British I zpodintonary Forse for 14 months serving as a secont. Its left Uganda October 20th and Decumber 24d Mr Cottar look. The work of all his hunting trips and these, he asys the will proterve as a record for hus family he will preserve as a record for his family

I called on Mr Cottar shortly after his arrival in New York and saked his opinion on the airplane as a transportation medium on the airplane as a transportation medium, in exploration work I found him very enthusiastic over the idea and he said that he wished many a time that he had an airplane when hunting elephants. When these animals hide in the tall buffalo grass, which is higher than the elephants, it is hard for a hunter to approach them Mr Cotter said that elephants in droves of 1 000 or more are found in this grass idea would be to fly over the herd and then blaze away with a rife or a machine gun at the animal selected for prey After the herd had been frightened away, it would be an easy matter to venture into the field on foot and take charge of the

mine mine inine inine mine inine mine inine inine inine inine inine inine inine

Conditions in some parts of Africa are such according to Mr Cottar, that the simplane could be used to desirable ad vantage in reaching places which hitherto have been maccessible The following is lis statement on the subject "From urobi to the Abyssinian border, a distance of about 325 miles, there is a first class automobile road which has been used for military purposes On each side of this road we have what is known as the North frontur country, and this is partly deser and a very large area of it is unexplored It would be easy to use this road as a bar for airplane trips into the interior of the country and from my knowledge of the

land, there are open spaces on which landings onuld be made.

'Then again there is a railroad running from Narrobi to Lake Victoria Nyanaa, and after this has been crossed by boat the

journay could be continued by a good truck road for a distance of 165 miles to Fort Portal Nine miles distant from this town we have Mt Ruenson a peak of about 16 700 feet The summit of this mountain is seldom seen on account of the clouds that constantly hang about it Southwest of Mt Ruenson is a vast un explored country and by looking at the map you will find no markings as to what a person may find here. This should surely offer a most promisingly fertile field for the explorer

Forty miles south of Fort Portal is an open and flat country the elevation above sea level being not over 3 500 feet. The grass here is not much over six inches high in many places and it would be just what an aviator would want for landing and starting his machine If an airplane could fly a distance of 200 miles from this point and return the aviator would have an excilent opportunity of making ob-servations over a country which as far as I know no white man has ever seen before This is the territory that is known for its savage dwarf like canni bals and the home of hig game Elephants are found by the thousands not mentioning lions tigers and other beasts of the forest

I believe a hunter while in flight could bring down a tusker without any trouble. The battleplanes in Furope have flown over trenches while machine guns were spraying lead on the enemy Apply the same tactics when after hig game and you are bound to get something. The flying machine could also be used for carrying an animal like a killed hon or a leopard from the interior to a highway or a railroad for transportation

As before stated the type of airplane used for exploration work would have to be of a different design than that used for commercial or military purposes I will give a description of a twin motor tractor triplane designed by Leon N W Colin a young aeronautical engineer of New York and which he says would fulfill the requirements of a plane for the explora

The machine which is the cover subject The machine which is the cover subject of this issue would have a span of 77 feet a length of 4d feet a maximum height of 19 feet gap between the wings six feet total weight 600 pounds useful load 5800 pounds and it would be equipped with two 300-horse power engines. The machine would have a minimum mileage of 850 miles 10 hours range of action and it could reach an aktitude of about 20 000

Its landing speed would be 30 miles per hour. The fuselage is six feet high four feet wide and 40 feet 6 inches long. It is mounted between the center and the lower wing I he tanks are located in the fuselage also compartments for carrying supplies spares and cargo amounting to a total weight of 2 200 pounds. In front is the open pilots compartment and back of him the enclosed compartment for two

The span is 75 feet the center-section is 16 feet wide and the wings are hinged thereto so that they can be folded back wards to occupy a small space. When the wings are folded back the machine requires a road width of 33 feet for travel ing from one point to another The located on the upper and center planes and inter-connected

The landing gear is of the double-wheeled V type with a distance of some sixteen feet between the skid portions

Three stanchions in a vertical plane of each side of the center section under the motor are the features of the chases supporting the machine Two additional stanchions brace the fuselage diagonally to stancions prace in electronic angularly to the chassis and the wheels are so mounted as to permit the change of its vertical airs with respect to the nature of the ground, and its irregularity Rubber cherd is used as shock absorber and it is enclosed in a housiage in order to prevent entangling

in the grass. If the machine is landed in high grass there is a maximum distance of ax feet provided before the top of the grass ax feet provided octors the top of the grass will found the wing center-section. The tail skid is designed to give as little ob-struction as possible in high grass. The skid is of the savied type, to prevent racking the body in side landings. Rubber chord is used as shock absorber

A liplant tail is used The tip counter belan ed decators are hinged to the stabilisers and three counter-balanced rudders are the support of the upper stabiliser plane one in the center, and one on each side in the center line of each motor. A which is provided in the cockpit to change the angle of incidence of the stabilizers If the machine lands in high grass and the motors are running, the stabilisers are put to their maximum angle of lift in order to carry the weight of the tail. The inchne I stabilizer as to aid materially in its rusing Upon clearing the grass the The muchine is able to fly and climb with only one motor running

### A Universal Printing Machine (C minued from page 846)

multifit if operation that stops the

pl (

the accomplished, the paper moves
firm rl 11 nucles bringing the next
length in position in passing forward
the listance it passes through what
am unto to a cylinder press, and it takes
in pieses in from two electrotype plates—
out for the letterliead, one for the signature, aut araph or otherwise After it stops again at the end of these operations it is cut off to a length of exactly 11 inchesand there is the complete letter Pro-vision is made for a double printing of the letterhead so that part of this may be in, an red and part in black, while at the same time the signature may be in any ook r at all in fact, the only huntation to the four-color effects obtainable is that the fill in must match the body of the letter, being printed through the same ribbon

In addition to this operation of printing filled in circular letters, which is what the filled in circular letters, which is what the machine is primarily designed for, it possesses other capacities. It can be convicted into an ordinary printing press by the shifting of two gears, cutting out the ribour-printing mechanism. The paper their flows through the machine continuously without starting and topping and letterheads order blanks, laundry tackets, hand bills, etc. may be produced at from 5-1990 to 50 000 per hour Again, with a very simple attachment!

Again, with a very simple attachment we may convert it into an envelope machine which makes a complete en-velope barring one fold of the flap which velope must still be done by hand. The envelope is crossed and gummed ready for the fold and at the same operation is directed from the drawer of address plates, and receives the return card in the corner. The same speed is here attained as in the case of the rcular lette

An interesting added feature is the An interesting added leature is the ruling device A set of ruling pens is mounted over the web of paper, which of c urse always moves in the same plane ily propor settings of these pens, any desired longitudinal ruling may be obtenned, and as the paper flows through the machine cross-rulings and column hadings are printed. The primary pur-pose of this is to make possible the printing of order blanks, but of course many other varieties of business stationery can like-

possible to rentificte the triangle or proposed to their extent. The fact remains that up to the per-

The fact remains that up to the present the public have nothing most share to assertion on the part of the advantes of the Canal Street project that is, and the ventilated, and it would be a great again faction to all concerned if the magnitude investigation of this very vital matter sould be published in full This would certainly be more satisfying to engineers and to other interested, than the delivery of invective and indecide of those that have the termerity according to those that have a treating to question the particular point. The statement was made by Mr O'Bagirle in the daceauon that the figures made by the writer of the artsie in your issue of August 4th, 1917, were based on the friction that would be encountered in the rough bore of a mine, and without attempting to refute this statement, any one who has in the least considered that vital question must 4t once have deended that the wagods and autors positing the tunnel full, would and according to the control of the contr

The writer is one, who like Mr. Landen thal, is anxious if the matter cannot re ceive an unbiased investigation and report serve as unbussed investigation and report, to see the tunnel quickly built to arrive at a practical settlement of the whells bentroversy. The remark of one principles angineer that it was better to build ane small tunnel at Canal Street, and interest, and interest. others at points above this location in order to prevent the congestion that storid order to prevent the conjection that wright follow the completion of the grappesed bug tube, applies with equal force to the trying out of this matter of ventilation on one small tunnel before spending so much of the public funds in what is most surely

of the public funds in what is most surely an experiment. The writer hopes that Mr O'Rounke will be allowed to build the sunnel, if it can be determined that the best interests of the two states will be best served by auch a means of carrying the traffic across the Hudson, but I believe with Mr Forgic that the figure named by Mr Forgic that the figure named by Mr O'Rounke as about 50 per cent too low, and of the contraster were involved in such a first the contraster were involved in such as the contraster. to see the states drawn into any

CHAS E FOWLES, Consulting Engineer

### Fuel from Household Waste

A METHOD of utilizing ordinary household refuse has been invented by Mr Reginald Brown (President of the Institute of Municipal Enginetts of Engineers land), who has supplied the following particulars. The process is in operation at

particulars The process is in operation at Southail, Middlesex.

It is claimed that the whole of the refuse collected from houses (such as ashes, unders, paper, straw, and vegetable matter) can be dealt with and turned into fuel, thus conserving the cost supply Mr Brown assumes that in a community Mr Brown assumes that in a community having a population of 100,000 there would be 25,000 tone annually of refuse, and he show that the sale of the prepared fuel even when marketed at a low price, 'would result in connectrable reviews and profit. On arrival at the refuse disposal secks the refuse is tupped into a crusher and reduced to a powder. It is then lifted by an elevator and made into small blocks by means of a braqueting mechine. No briefly gratering is added at this stage. From the braqueting machine the shoots are placed on carrying trays canalls of

varieties of business stationery can like and the state of the state o

of many enjoying value be required, the believes, instead of being disped, are placed in a sylinder and impregnated under

pressible.

28's pointed out that oil-tar is used bestiles, of its high disinfecting, calorid, unleaded by gra and Mading qualities, as it contains 20 locomotive cranes price in a first price i

On the question of cost the inventor states that the expense of conversion in pre-war days amounted in England to \$1.6% per ton while the vlaue of the finished product is about half that of best coal Before the war a plant capable of dealing with 34 [one daily would have cost from \$7,500 to \$8,760, including the buildings The latter would cover a space 75 by 32 feet, with a storage shed 32 by 20 feet Such a plant, turning out annually 6,000 tons at a cost per ton of \$1 82, would is about half that of best coal

f the briquets were sold at the low rate of \$2.43 per ton, bring in a profit of \$3 660, while an output of 25,000 tons annually

while an output of 20,000 rons annuary would net \$15,250 in excess of cost. The inventor adds that, besides being a means of providing a valuable fuel out of material now wasted the briquets can be used for domestic and steam-raising purcost of disposal The process is fully protected by letters patent in Great Britain and other countries

### Storage of Coal Under Water

THE October 19th issue of the SCIENTIFIC AMERICAN contained an interesting article on the weathering of coal in which under-water storage was mentioned as the safest method of keeping bituminous ecal. Most people who store coal are agreed on this, but while the Brunot's Island reservoir, illustrated and described sman reservoir, mustrated and described in the previous article, may indeed be the largest one deliberately created for the purpose of coal storage, it is by no coeans the largest pit used for that purpose A Kankakee, Ill., company has a com-

The pipe line, 10 inches in diameter, rests on pontoons. To reclaim he coal, the proce es as reversed, the coal s pumped from the quarry into the conemis pil at the base of the inclined sievator. When this pit is illind, the water overflows back into the quarry. Coal from the pit sievated by a flight of perforated buckets through which much of the water drains, and is delivered nnto ears on the railroad track. Two thousand tone per night-hour day ona the unkeded from are into the quarry, and 1 600 tone reclaimed in the sense time. All coal up to three inches can be a first of the coal up to three inches can be a first of the coal up to these inches can be a first of the coal up to these inches can be a first of the coal up to these inches can be a first of the coal up to these inches can be a first of the coal up to these inches can be a first of the coal up to t

At Whiting, Ind , there is snother under-At Whiting, Ind, there is another under-water considerings plant even larger than the case just described. This pit, which was also crisically created for another purpose, \$4.1000 feet long, 200 feet wide, and 28 feet cleap. It has been lined with sconegie that first black on the hottom, with say, by the prior level wooden place \$60, then, her, the pides; these are me-rically also the property that is the concepts can-

ping. Four treeties carrying standard gage tracks extend from end to end of the pit, and there is a track on each bank parallel to these In this way arx trains may be handled at once The coal is unloaded by gravity and reclaimed by

A concrete storage bin of unusual design is located at Hilladale Mich It consists of a pair of reinforced concrete bins 28 feet in diameter and 78 feet deep Bottom dump cars are unloaded through a track grating the coal being then carried by a conveyor belt to a bucket elevator and dumped into the bins at the top. The bins are roofed and so constructe prevent the free circulation of air precaution against fire each bin has six 1-inch pipes set vertically, each pipe having an opening at the top and three intervals along the side With these it is possible to flood the bin from a pressure line in the event of a blaze

### Hints on Storing Timber to Prevent Decay

MAN) serious losses from decay in wooden structures are possibly duc to the fact that the tumbers used were in fected with wood-destroying fungi whil reduced by keeping lumber storage yards it a sanitary condition Strong efforts should be made to stor

the product on well drained ground, re-

high tides and standing water
All rotting debris scattered about yards All rotting debris scattered about yards should be collected and burned no mattri whether it be decayed foundation and tramway timbers or stored lumber which has become infected. In the case of vards aiready filled in to considerable with sawdust and other woody debris the attuation can be improved by a heavy surfacing with soil, slag or similarimaterial Weeds should be cut away from the piles

to allow good ventilation

More attention should be given to the More attention should be given to the foundations of lumb r piles in order to insure freedom from decay and better ventilation beneath the stacks Solid foundations should never be used in humd regions the stock should not be piled less than 18 to 24 inches from the ground Wood blocking used in direct contact with wet ground should be protected by the application of crescente or determined to the surface of t

piles will slope approximately one inch to every foot of length

back Instead of throwing the "stickers about on the ground to become infacted with decay, they should be handled carrfully and when not ru use piled on sound foundations and kept as dry as possible II pine, saturated with roun, or the heart wood of such durable apecies as what cak on the same and the dates of the da

wood of such durable speares as wate oax or red gum be employed, the danger of possible infection will be greatly decreased in storage shads the necessity for piling higher from the ground is very appearant in many cases. The same remedies apply here as for pile foundations in the open The sheds should be tightly roofed and the siding should not be run down be bottom of the foundation silis Free at ourculation should be allowed from a

circulation should be allowed from all sides beneath the inclosure Only throughly dry stock should be stored in slow piles under cover outbreaks occur in storage shade not constructed to meet sanitary needs the infected foundation thabers should all be form out and replaced with wood seaked as an antiseptic soligition or by considered to brick In all assess the needs

### Don't Re-cover Your Old Leaky Roof -

Save the needless expense Investigate Stormking and you will find that you can apply this new Asbestic Waterproof Coating over your present roofing and save all the labor and material cost of taking old metal paper or slate off and putting a new material back on

### "Coat it with Stormking"

Stormking is not to be compared with paint or ordinary commercial coatings. It is guaranteed for ten years and positively solves all roof repair troubles

Stormking comes ready to use no thinning or mixing It adheres to every kind of material and can be applied by anyone in any weather

Write us about your roof -size and present covering and we will send cost estimate, testimonials and literature Address Dept "B

foundations should be so constructed as to keep the lumber well off the ground, and the soil and timber immediately adjoining the soil and tumoer immediately adjoining the infected area should be sprayed or painted with an antiseptic solution of a water-soluble sait, like sodium fluorid, mercuru chlorid sine chlorid, or copper

A more detailed discussion of methods of handling lumber to prevent decay is to be found in Department of Agriculture Bulletin No. 510 Timber Storage Con ditions in the Eastern and Southern States with Special Reference to Decay Problems obtainable from the Superintendent of Documents Government Printing Office Washington D C price 20 cents

### Plant Fossils and the Past

THAI plant fossils are the keys which unlack many of the mysteries of former world conditions is a known scientific fact yet one which never losse its charm fact vet one which never mess as the mand freshness. Every research among these relics of a past life yields some new information of intense interest. It is now practically certain that fossils not only act as aids to the study of organic evolution and indicate climatic changes and old land surfaces but also outline former continental

When certain kinds of petrified plants are found in different parts of the world it is possel le to correlate their ages however far apart they may be I hus rocks of Antarctica are known to be of Jurassic age, since they contain fossil ferns which are found in the Juranese rocks of Furope great economic value in recognising strata
of rock which contain oil or valuable metals

If the same species of land plants ex isted in Antarctica and Furope there must have been a land connection between the countries allowing migration of these plants countries allowing migration of these plants from one place to another. The presence in the western part of the United States of fossil leaves of the Ginkgo or maldenhair tree now found only in Asia, is an indication that North America and Asia have leen formerly related no doubt across the Bering sea Similar evidences show past land connections between Greenland

the rocks of all these piaces contain im-pressions of the same vegetation for dogusts have called fossil plants thermometers of the past because they mark luations which ages ago constituted either tropic or arctic regions but which now have the mild weather of the tempernow have the mind weather of the temper-ate zone. When in Iowa and other middle western states leaves of the palm, fig magnolia and breadfruit are found mingled with the impressions of deciduous trees millions of years old it seems to be a fact that the region was formerly tropic Just as leaves which fall into streams today may eave impressions in the clay, so in the past falling haves pressed their outlines down The presence then of these petrified outmes must seem a conclusive proof of the

Rock impressions show that only the

neechs such as bees and wasps, at that the state of the concelling 
### Steaming of Vehicle Stock During Kills Drying

SATURATED steam as a means of alleviating the tendencies of green lumber to honeycomb in the kiln has for lumber to noneycome in the Emm sas for some time been successfully applied in the commercial drying of heavy vehicle stock Such treatment has meant the difference between success and failure in many tills runs It has afforded the means of overcoming discrepancies in operation or mis-

withstand rigid drying conditions
So far, however the steaming treats has been confined to straight stock contention has always been that bent stock such as rims, should not be steamed after removal from the form, expansions indicating that stock so treated would tend to straighten out to its original shape. The kiln drying of heavy bent rims has been carried on therefore, without resorting to steaming to remove casehardening and other defects of drying

Recent experiments conducted under the direction of the Forest ProductsLabors carection of the Forest ProductsLaboratory
have shown that judicious steaming of
heavy bent vehicle stock results in a conaddrably improved product and that the
operation can be accomplished without
serious effect upon the curvature

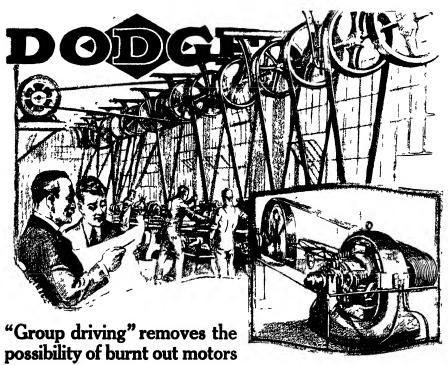

Careful judgment is necessary, however as it is a very easy matter to run the entire charge Contrary to the by too severe treatment by too severe treatment Contrary to see common impression, this steaming has been done at high temperatures (180° 180° F) and for short periods (18 to 8 hours) the temperature and time varying

according to the requirement of the case
The method was given a rather severe
test, being trued first on 50-inch oak rims
and later on 60-inch artillery wheel stock
When applied to the kiln drying of heavy
oak rims on a commercial bass it worked osa rims on a commercial main it worked out very successfully Checks in the stock before ateaming, which showed pinching in tending toward honeycombing, closed normally without damage after steaming Of 2 400 pieces, the losses attributable to kiln drying were only two per cent

### Resistance of Suspended Wires

past land contextions between the past land contextions between the past land contextions between the past land context on the west and North America on the west and Englishman, described some experience of the past of the past land to the past of the past land the past land to rent traveled upward, the resistance of a copper wire was slightly greater than when the current was flowing downward. In the case of an iron wire the resistance was greater for the downward current effects were so small that Bidwell hesitated to publish the observation he ascribed the changes to thermal (Peltier) effects

in the wires stretched by their own weight.
The observations are confirmed by experiments described by S. R. Williams, of Oberlin College, Ohio Williams suspended wires so as to form an inverted U or V, connecting the free lower wire ands with a Wheatstone bridge Such a wire would be more stretched in its higher portions near the point of suspension than below and a current would travel from The continuous properties of the continuous an unstrained to a strained portion up the one leg, and from a strained portion to nsects such as bees and wasps, at that had to use insulated wires (alk covered),

Engineers have accepted Group Driving as the most effective and economical manner of using motors

Where several machines are grouped together and driven by one motor in connection with a line shaft, Dodge products are generally recognized as a Roadbed for Power that fully measures up to the requirements of both motor and machines

Dodge Products are standardized and interchangeable Nowhere have Dodge Products so proved their adaptability to unusual condi-

tions as in the modern method of group driving Perfectly balanced and true running. Dodge line shaft and clutch equipment produces the fly wheel effect of an even load on the motor at all times

thus the shock and "peak loads which would otherwise be thrown

directly on the motor, are removed

In Group Driving the Dodge Friction Clutch and cut off couplings are accepted as the standard medium for throwing the individual machines in and out of service as desired and providing for a division of units to suit special conditions of operation or when one unit or any part of the equipment is not

One of the most difficult problems of the electric drive is met when lew

speed is required

Dodge Equipment in such an instance supplies the economy which would otherwise be lacking, due to the high first cost of a slow speed motor

Regardless of the ratio of speed reduction-regardless of the short center to center d tinces available—a D dge Rope Drive will preve the simple t and m st economic means f changing ver the steam driven to the electric hiven equip ment

If you are changing over fr m steam to electric poweror if y u will electrify the operation of the machines in y ur plant cill in a D dgc Ingineer from one of our la branches or fr m Mislawaka and get his suggestions made from a technical study of y ur actual requirements charge whatever for designs and opinions submitted

'Nobby Cords' are extra muleage tires. They are built of many layers of strong, sinewy cords imbedded in live, springy rubber. They are tough—incredibly strong—absolutely dependable at any work you have

for them to do.

Our nearest Truck Tire Sales and Service Depot can supply you with 'Nobby Cords'.

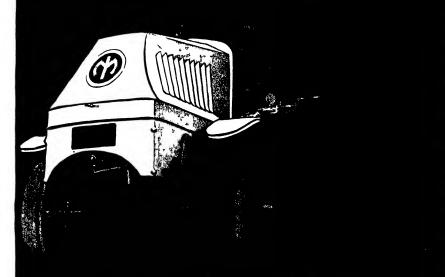

Everywhere one sees the big, dominant MACK pushing masterfully forward on street and highway. Foodstuffs, raw materials—the products of farm, mine, forest and factory—are all hauled speedily and certainly by MACK Trucks.

are all hauled speedily and certainly by MACK Trucks. They settle the questions of greatest trucking efficiency and least operating a xpense. Special MACK hodies, labor-and-time-saying loading and unloading appliances and to economical operation MACK performance is daily performance. That's the whole story—what every truck purchaser should demand—what thousands of MACK users get.

Made in 1, 14, 2, 34, 54 and 73 tous. Ready for immediate delivery. Send for specifications

General view of the elevator and two-car dumper at Sewell's Point, Va.

The dumper in action with two cars in the overturned position

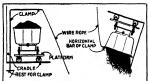

### The Biggest Car Dumper in the World

THE United States as the land of hig car dumpers our medium-nared real cars haul 45 50 and 60 short tons of cool, the gante used to a greater or less extent as the Norfolk & Westers Railway in hauling coal from the Alleghenes to indewster at Hampton Roads have a capacity of 100 tons. Naturally, then, the dumper must correspond But the Virginana Railway at Nevella Point, Hampton Roads, Va., has recently installed a dumper to handle 120 tons at a trp, without having been forced to this step by any increase of railrand coal cars to a sorresponding load capacity

to a corresponding lead capacity
The new matallation handles two 60-ton cars simulsanously Two loaded cars, standing end to end are
overturned adverse and their contents dumped
American dumper always operatory overturning the
American dumper always operatory overturning
matchines. These latter type the cars endwises. This
seconstates an end-gate on the ear to portant the discharge of the coal The Lengths typ about 70 degrees
which is an advantage, and are often able to accomplish
toping with skeleton equipment very simply operated
However, compared with the American giants, their cars
set for the most part almost two parts.

At Sewell's Point there are some millions of tons to be handled per year, so that high especity is of the utnost emportance. In about two minutes, the new dumper goes through its cycle of operations and dumps its 120

One of the most interesting things about a car dumper—the most interesting, perhaps next to the method of versturning—is the little cable car called a "mule a brazeng". I'm gound-hoy "Modern American ardunipers st, as a rule, elevated more or less ab. ve the general toward to the state of the dumper towards and discharge cost. There is a longer or shortest inclined approach to the site of the dumper, over when the smule punkes the one or more loaded cars which it is bringing to the oradle of the dumper I runs on the state of the sta

First and final positions of the carriage and car

Incline to damping philippy, showing transfer our

some conditions it has been found degrable not to depend upon gravity to return the mule from the top of the incline but to attach the tail of the cable to it and return it by power

return it by power. The requirement of overturning care sidewise in an American dumper is to run the loaded car out on the platform of an 12-shaped readle an after loading the whole to the desired lived, to overturn both car and credit. The I turns on an axis parallel to the junction line of the historical and the vertical parts of the reads in the first of the first

The new dumper at Hampton Bonds has a cradle long rought to receive two case. In addition to taking care of the great length it is also increasing to provide for marked difference in the body widths of the two care by dividing the platform into two sections. Care coming upon the cradle must be to a few transcapacity tween one case the space would be at monimum and with narrow mess at a maximum. As the overturn begins the load on the short kingth of rooks in the cradle begins to diminish and weight comments at come upon the normally vertical pixel of the L. This transfer continues until 90 digress of rotation have been completed at which moment the care will rest entirely in its side against this moment the care will rest entirely in its side against the short known quitting in a sudden shift of the loaded car at the bigning of the overturn it is customary to attain the side of the care of a stranger the short lingth of raiss on a movable platform. This platform rests on which or their equivalent and these are carried by the cradle proper the platform shifting transversely to the track. Now in the case of the two-care dumper there would be with raiss of horizontal shift needed to get the two ready to

### American Shin-Operating Program

III operation of a large merchant marme is complicated and difficult to a degree that is mly understood by those who are engaged in it and Mr. Hurley is to be congratulated upon the clarity with which he handled this problem in his recent address before the National Marine Lengue in this city. In a previous address on the question of our shipping be dealt with our great constructional program—what it had done and what it pripried to di. In this address for the first time. he give in outline. I his preposed plan for the ownership and operation of the vessels built for the Government by the United States Shipping Board of which he is Chairman

The outstanding feature of the address to our way if thinking was his caudid idmission that he was un alterably opposed to government ownership. In un mistakable words be ann un ed that as the result of his own experience both in private histness before the war and since he has held his high position in the councils of the Government he was our meed that only by the sale of the ships to private owners and their operation by private interests would it be possible t so are that combination of energy and institutive which are necessary in all lusiness enterprises and nowhere more so than in the matter of the operate n of a great mer hant fleet At the same time he would have the fleet operated in close execution with the Government both in respect of advice and of financial support. He aims to prevent the passing of the flut under the central of a few great companies by framing the terms of purchase and governmental operation so that watering of stock would be prevented and the field would be kept own to the small operator whose opportunity to compute with the large operator would be protected by the Government

At the present time the United States Covernment owns 555 occan going steel cargo ships aggregating 3,385 475 deal weight time. In addition it has under contract 1 336 similar vessels of 9 275 006 dead weight tons If our present program be carried out there will be under the Amerian flag next year 16 732 700 dead weight tons (11 155 000 gross tons) of ocem-going steel cargo and passenger ships. Of this total the Government will own about "O per cent or say 11712890 dead weight time (7 809 000 gross tons and the nation must at once determine what use it proposes to make if this great national asset

Many are the plans which have been considered and they range between straight government ownership and uperation on the encelled and upregulated private ownership and peration in the other. In then order as given by Mr. Harl's they are first government ownership and opinion soud g vernment own relip and printin frite brackt fith Covernment through the medium fapriva apartir a third government awnership and crivate a rate of re-vernment account fourth government own rship on liprovite op ration for private account 1fth own 1 1 by 1 single private corporation and listly privit wincrship and operation in which the vessels would listly privite companies to be operated by them entirely for their own account the Government thus relinquishing all interest and control

Mr Hurley's recommendations are that the ships shuld be sold to and operated by American ortizens under no restrictions other than the terms of the bill of sak and the fixation of maximum freight rates and he considers the ships should be a ld at a price which fauly reflects the current world market for smaller

Inder this arrangement 2 pri it of the purchase price feach ship would be pri level at the date of purchase the remainder falling line and payable in graded annual metalments extending over a period not exceeding ten years. The Government would take a mortgage for the unpaid balance harging the customary commercial rate of interest of the per cent. One-fifth if this interest representing the billerence between the enstonary government interest if ar per cent and the ustomary commercial rate wo libs paid ato a Merchant Marine Development I in I

The purchaser would be required to agree to insure and keep insured with an Ameri in marine insurance company has equity in the visil and because the American marine insurance market has not at present sufficient resources to underwrit. Il the vessels which the Covernment has to sell to Covernment should arry in its own fund as at present but for the purchaser's account insurance in the bull and machinery covering that part of the vessel in which payment has not been made

No vessel could be transferred to foreign registry without express permission of the Covernment and each purchaser who wished to operate in the foreign trade would be obliged to incorporate under haderal charter One member of the Board of Dire 1 is for each company will be usued by the Government he will receive no salary but only the customary directors for for each meeting be attends. Thus government named directors would meet periodually in Wash agton where they would confer with and advise the Shipping Board

the Merchant Marine Devil pment Fund representing me hith of the interest n the mortgages would start with \$7 650 750 the first y ir and the size of the fund for the 10-year period in whi b the ships would be fully paid for would be \$83.513 | 0 | 1 his fund would be used to relieve such financial lift ultus as may be encountered in the development t in adequate and wellbalanced American merchant murine Thus realized that a number of trade routes important to the immediate or future welfare f American commerce. must be established and developed. Some of these routes may not yield operating profits until their existence shall have attracted an increased volume or better balance of trade Thus, in cases where the Government sells a ship upon condition that it be operated in a route which may not prove profitable at once at will be necessary to provide for the payment of defaulted interest from this Merchant Marine Development Fund

Mr Hurley in conclusion stated that his plan was hased upon profound convictions formed after close personal studies of conditions at home and in Furope and after careful consideration of the best information he could obtain of what is going on in other quarters of the globe. At the present writing we are inclined to agree with Mr Hurley that among the many proposals which have been made this plan as thus briefly ske ched presents the best promise of meeting the situation. The whole address which is worthy of careful reading is published in the current issue of the Suprimment

### Our Special Correspondent in Europe

ITH the publication in the present issue of Mr Claudy s article on British Munitions' we bring to a close the series on reconstruction in Lurope, so far as it cincerus Great Britain From London our correspondent went to Paris and the stary of reconstruction in France commences in the acxt issue and will run through acveral numbers

The problem of swinging the whole energies of a great nation around from the activities of war to those of p 1 ( is scrious in any war and in a struggle of the magnitude of this war it is simply stupendons. In the east of strucken France, whose inclands were for many years the principal arens of the conflict the task of reoustruction is not only stupendous in magnitude but uttorly bewildering in the complexity and infinite variety of the contending claims, each of which calls for quick relief In Lugland where, save for the occasional and limited destruction wrought by the Zeppelin and the sirplane, the material damage was relatively negligible, the resc struction problem, as Mr Claudy shows, is saturely sconomic points al and social—it is a mechanical problem. of placing was plants on a peace hasts of the construction of delayed buildings of restoring run-down railways of rebuilding shuttered industries and above all, of readjusting labor conditions

The I reach Government must also do these things but overshad wing them all there stares it in the face vast stratches of the fairest lands of I rance once teeming with inhabitants and a hive of manufacturing industries. which he today as barren desolate and devoid of inhabitants as the desert of Sahara | The magnitude of the problem which confronts the I renell and the methodical way in which they are applying their intelligence and ourage to its solution, will be told by our correspondent in the series of articles which will commence in our following issue This material was gathered from official sources in Paris and after an exhaustive personal exploration of the stretch of wasted land lying between the North Sea and the city of Verdun

### British and German Gunnery

ONSIDERABLE discussion has been going on in the British press of the respective gunnery resultin the British and German navies particularly at the Battle of Jutland Critics of the British methods clause that the sinking of three of Beatty's battle-cruisers in rapid succession proves that the German fire was more efficient An explanation of this superiority is found in the supposition that the German salvos were "bunched," whereas the British were relatively scattered, that is to say the British aimed to get in one hit in every salvo whereas the Germans expected that some salvos would miss but that several bits would be made in each salvo that did land

In explanation of the above it should be stated that no two guns of the same type or mark, shoot exact alike This is due to slight but apparently unavoidable differences which serve to scatter the shots from a broadside say of a doren 12-inch guns. Some of the shots will drup over others short of the target, and the extreme difference may be as much as 1 000 yards at great ranges. To correct this, the guns are calibrated' ertain corrections are made and the sights adjusted After a broadside of guns has been calibrated all the shots should theoretically fall on the same spot, though differences in the respective charges of powder may ause some dispersion in spite of calibration

However let us suppose the calibration has been well done and that the powder is very uniform In this case, if the range-finding is correct and the gun-pointer expert several shots of a salvo will land on the ship. Good But if ranging is difficult and the gun-pointer is not quite up to form the target will be missed altogether and not a shot will go home. Now it is these considerations that have made gunnery officers prefer to have some dispersion in their salvoes for if the shots are spread out over several hundred vards the mean point of impact does not have to be exactly on the ship in other words, although aim may be a little long or short, one or more shots will have a good chance to land

The British favor-or, at least, they used to favorhaving a certain amount of dispersion in their broadsides

Sir Percy Scott, the father of modern gunnery and particularly of director-firing once told the writer that when he took over a certain new dreadnought, he did not calibrate the guns closely, believing that he could obtain better target results in this way

In the earlier stages of every engagement the German gunnery was good but as soon as the British got "on," there was a rapid falling off in accuracy This may be explained by the possibilty that the German system of director-firing involved elaborate electrical connections, the breaking of which by landing shells disorganised the whole system Or was it that German nerves were shaken by the burst of 13 5 and 15-inch shells?

We are inclined to the belief that the comparative immunity of the German battle-cruisers of which only one was sunk, was due more to superior protection than to better gunnery. The High Seas Fleet was built for service in the North Sea the Grand Fleet for possible service in far distant waters Coal capacity and berthing space were sacrificed in the German ships for elaborate subdivision of the hull, heavy side armor and complete armored decks.

### Engineering

A New Hatbor on the Baltic. It is reported from Copenhagen that is new harbor is to be constructed at Konte, which is a Danish seaport 00 miles west-aouth-west of Copenhagon. The cost of this work is estimated at \$0,000,000 kronts and it is stated that American capital has been interested. The harbor will have a depth of ten meters as against min uniters in Copenhagon and large quays will be built with ample facilities for handling merchandes.

Comment Joints for Water Mains I he Burcau of Water Works of Portland, Ore has been using cement in place of lead for the joints of its cast iron water mains According to the congener of the Bureau one jound of commant at half a contribution of the state proposed of the state of the position of the state proposed to that there is a material saving in cost I for labor of making the joints, however reduces this saving because the comment joints have to be kept wet for from 8 to 48 hours. The joint is first parked with yarn and oakun and then neat comments forced and the neat comments of the state of the property of the state of the stat

Speading up the Hardening of Concrete—Inburseu of Standards recommends the use of a small quantity of calcium obloride in the mixing water of concrete in order to accelerate the hardening of the concrete. Tests conducted by the Bureau show that the addition of calcium chloride up to 10 per cent by waight to the mixing water increases the strength from 30 to 100 per cent over that of concrete in which plans water is used and that the best results are obtained when from 4 to 6 per cent of calcium chloride is used. While calcium chloride has in additional so and the concrete it does aftert iron and steel and therefore the saft should not be used for removed control to the saft should not be used for removed control to the saft should not be used for removed concrete the saft should not be used for removed concrete.

How Much Water Should Be Used in Concrete?—
The Emergency bleet Corporation in connection with
site work on concrete vessels has developed an apparatus
for testing the amount of water which should be used in
concrete work. An open metal cylinder is employed,
resting upon a glass plate. This arrves as mold which
is filled with concrete and amouthed off level on top.
Then the cylinder is reased leaving the concrete on the
glass plate. If the muture is very dry the concrete
will maintain its cylindrical form but the wester the
concrete the more it flows out at the bottom so that is
measure of the consistency of the muture can be obtained
by measuring the hoight of the cylinder or cone of concrete after the metal evidined has been withdrawn.

I Treating Rallway Ties with Zinc Chloride—The American Rallway Engineering Association while admitting that presents in generally the best preservative for railroad ties calls attention to the fact that there are cortain conditions in which it cannot be used consume ally, and under such conditions recommends the use of ance obloride instead. One of the objections to raise chloride is that where there is excessive rainfall there is a not usually very as rous and it can be checked to some extent by the use of a liberating securit. In this should be seasoned for 60 days after treatment we as the increase their strength and so at to reduce the amount of leaching of the microfildrate. This also reduces the lookage of surrous from the rails.

Novel Bridge Engineering -Not long ago it was discovered that the piers of the combined highway and railroad bridge across the Missouri River at St. foseph Mo, were in bad condition and it would be necessary to build new piers At first it was proposed to build the new piers on the downstream side of the old bridge and shift the bridge laterally to the new position, in this way maintaining traffic over the old bridge while the new construction was going on But the War Department required the installation of a larger draw-span in the bridge and so it was decided to build the new piers between the old piers After they were completed, the fixed spans of the bridge were moved shoreward and wise, so that they rested on the new piers A temporary pan was constructed to fill the gap thus occasioned so that traffic was closed over the bridge for less than ten hours Then work was begun upon the new swing span which was built as a cantilever in open position permit of this, a portion of the old swing-span had to be out away and a temporary lift-span was put in to take care of river traffic. Thus the bridge was reconstructed without changing its almement and with a minimum interruption of traffic

Care with Scaffolds—During the most year their have been reported to the Burt are number of accidents which have occurred as a result of seaffolds breaking collapsing. I falling While those accidents are not frequent according to Sigle Bulletin they are as a rule of a 8 min mature. Construction of 8 sail idea of either mountained of the seaffolds of cutter that of the seaffolds of cutter that of the seaffolds are constructed as that they will and by stand the band kinch they are expected to bear. Nothing but the very best of meteral 8 should be completed.

Fuel waving I he raigh the cooperation of the fundational production by an explaints which have thus far put into force the standard re-ommendations of the United States and I and Administration is by an office feature in the defensive in the defensive in the use of fuel in power plants in saving of 7,000,000 toos similarly from the annumerous of the national program of \$500,000 toos have been conserved at the same time in annutation growth and the production in the factories of the production of the national program in the following states where the production is the factories of the production of the factories of the production of t

Deep-Sea Salvage Equipment -Owing to the dangerous nature of the coast and the consequent frequent wricks salvage work has always been of consideralle importance in Spain. This work has been increased by the war during which many vessels were sunk off the Spanish coast by the Uboats | The large profits from the business which before the war was largely in German hands have attracted the attention of cantalists in northern Youn and an important company has been organized to engage in salvage work flus company is well equipped but owing to the great extension of its activities new purchases are constantly being made. There is therefore an unportant market in Su un particularly in Corners, for the sale of the latest devices pertaining to this work, and also for machinery for the reduction of the salvaged metals

Use of Goggles A large number of accidents have been reported recently due to the workmen not wearing the goggles provided by most companies for employees engaged in certain classes of work. It is rather difficult to understand the attitude of many workmen toward goggles in view of the painful injuries that so often follow full me to wear them. There is no excuse for men not wraring goggles in such work as for instance disconnecting steam or acid lines. In a recent case, however two workmen taking down an acid his sustained psinful eve minries due to the acid solushing. It is for the foremen in charge of the work to take greater pains in explaining the use of, and the results of a failure to wear goggles while engaged in certain classes of work continues Safety Neus Goggles are provided for use and it should be impressed on the minds of workmen that they are to prevent unnecessary and painful needents

Sultable Tasks for Disabled Fighters -An outline of the efforts of the Bureau of Limpleyment of the Pennsylvania Department of Labor and Industry to and suitable industrial tasks to Pennsylvinia for disabled soldiers and sailors is given in a buildin just issued by the Department | Has bulletin which may be obtained upon application to the Department of Inbor and Industry at Harnsburg analyzes by task and locality the 50 000 copicyment opportunities offered by 900 emulovers in 60 counties number of plants kinds of firms and numbers of openings in each class of employment. One series of tables shows at what tasks several hundreds of disabled men are now employed by the Philadelphia and Reading Railway Company Another chapter on Placement of Disabled Soldiers and Sailors in I mplovment gives a general review of the placement subject outlining conditions that may be expected and methods to be employed in locating each disabled soldier and sailor at a specified task in Pennsylvania plants

and the strigid dirigible constructed by Great Britain the R-32—which made its first flight on March 6th last staying aloft some three hours

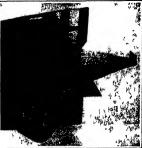

## Is the Dirigible Outstripping the Airplane?

### Recent Progress in Lighter-Than-Air Craft Which Has Brought That Type to the Forefront of Aviation

THIRT are all the elements of a good romance in the story of the dirigible. As the first type of airship to be taken up by the nations of the world the lighter than air craft proved quite unsatisfa tors. The numerous mishaps to the early dirigibles impressed on the minds of the general public an absolute contempt for that type They did not stop to consil r the crude nature of the dirigible—they did not recall that the steam locomotive back in 1830, was just as crude—just as inclinent— They simply condemned the dirigible on first impression

simply concerning the diriginal of next impression. Then came the airplane—there is something fascinating about the airplane with its delicate structure of fine ribs and fabric and the powerful driving engine and propeller and the publi immediately became attracted. to the heavier than air crift. Numerous intrepid air-nich did all sorts of daring stunts with sirplanes. Crude as they were in the early days much it the satisfaction and interest of the lasty. An it the eping days of the war found the arriplance evening practically all the attention from military suthereties to the more or less complete sex haston of the dargold—except in evening the complete sex haston of the dargold—except in even many.

The layman never could understand how old Count von Zeppelin could continue year after year to build his ungainly dirigibles. Indeed, it seemed that as fast as he turned them out they met with trage accidents and an untimely end. Yet the Count continued, and when his money gave out because of the long series of failures of

Tall members of dirigible, with lookout post

his earlier Zeppelins the German government came to his rescue and supplied practically unlimited funds. And again the Count wont on building more Zeppelins than ever and the more he built the more, so it seemed, were

destroyed. When the war came on Germany attempted to employ her wast fleet of Zeppelus—which she had accumulated faster than they could be destroyed under ordinary navigating conditions—with unsuccessful results. Truly, she manufaged the military value of these bugs drigbles, but when she turned them over to the navid authorities, they unmerdadely proved a bug success. As super-vector, where the construction of the propelus, which could be completed with the Zeppelus, which we complete with the Zeppelus, which we complete with the Zeppelus with the Zeppelus, which we complete with the Zeppelus with coming down for fuel or supplies

coming down for fuel or supplies
Great Britain, quick to grapp any new idea in naval
warfare, soon appreciated the advantages of huge rigal
dingibles. After constructing wast feets of small nonrigid and semi-rigid dingibles for anti-U-boat warfare,
sit turned to the construction of rigid afringles with turned to the construction of rigid afringles with right point of detail and performance may prove more than a match for anything
cermany has ever constructed notwithstanding the
world-wide belief that Germany is the only country in the
world-wide belief that Germany is the only country in the world capable of constructing huge dirigibles
That, in brief, is the romance of the dirigible

Forward gondois of the R-33, which contains the navigating quarters and a single 250-horse-power engine

Eryman New Os.

One of the two "power oggs" located amidukine, containing a single
210-horse-power stigles

son out despite all obstanles and against the greatest handscap of all—public opinion its war record, aside from its een splendid In four and a half years it has shown a greater proportionate develop-ment than the airplane, unbelievable as this may sound And now that commercial aviation is being discussed in a really businesslike tone, the dirigible looms up as the real acrial greyhound of tomorrow with the airplane as little more than a "feeder for the dirigible. That is to say, dirigibles will cover the long routes of arriguous will cover the long routes of thousands of miles, where quick trans-portation really saves much time, while the arplane will save to bring passengers and carry them away from the drigble stations located a thousand or more iniles

Typical of the immediate possibilities of the dirigible is the latest British rigid airship, the R-33, shown in the accompanying illustrations This dirigible, which made its trial flight on March 6th last which it remained aloft some three hours and reached an altitude of 2 000 feet is 670 feet long and 79 feet in diameter at the thickest point along its splendidly stream-ined body. In fact, the R-33 closely follows the lines of the German Schutte-Lanz dirigibles, which are stream-lined instead of pencil-shaped as were the earlier

The nose is round and somewhat tapered while the stern is tapered to a fine point and carries the openage, or tail members An interesting feature of the tail is the small lookout post which is shown in one of

the accompanying illustratary application of the dirigi-ble is used as a gunner s post The body of the R-33 is constructed of duralumin girders, covered with fabric and con-

### An Odd Automobile Accident

URING the right 250-nak road race at Santa Monica Call one of the cars met with an a cident at a sharp curve known as Death Curve Hen a sund bag barricade hel been erected ostensibly for the purpose of keeping the ears within the bounds of the red. The ear in ques-tion was going so fast that it could not take the curve but strick the barricade and leaped over the sand bags. Fortunitely neither the driver Roscoe Scarles, nor his mechanic was injured. More remarkable than the accident however was the fact that a photographer succeeded in snapping a picture of the car as it was in mid-an had taken a position at this point expecting to obtain some thrilling pictur's and was fortunate enough to make in exposure just as the accident occurril. The picture he took is reproduced herewith Note the cloud of sand thrown up from the sand bags and also note the t legroup pole which the car grazed as it plunged

### The Coal Supply

To the Editor of the SCIENTIFIC AMERICAN

I have read with great interest an article in the February 22d issue of the SCIENTIFIC AMERICAN under the February 22d issue of the SCIENTIFIC AMERICAN under the title "The World's Coal Supply The subject is one which deserves, and is beginning to receive careful attention and intelligent discussion. The article in question sets forth with admirable clearness and force tain important aspects of the situation, but as to one certain important aspects of the situation, but as to one wital point, the probable life of our coal reserves it con ways a very misleading impression Your article exhibits a chart "How long the coal will last", which shows for the United States 4,000 years

last" which shows for the United States 4,000 years and for the world 3,400 years, with an inconspicuous note to the effect that this duration is based upon present rates of consumption. These are the figures which the casual reader will remember, his impression will obviously be that our coal reserves are practically unexhaustible and not in any sense a matter of concern (or many). and not in any sense a matter or concern on tonary generations, or even centuries to come. The possible mathematical correctness of the figures in no way inti-rates their essentially mulcading character. The chart gates their essentially mustading character. The chart in question and the text of the article goes on to state that in question and the text of the strictle goes on to state that the "commercially available supply at estimated future rate of consumption is sufficient to last 1,500 years. This estimate is fallacious beyond any possibility of explanation or qualification. While it is quite probable explanation or qualification. While it is quite that some coal will remain in the ground at the 1,500 years, it is inevitable that within a small fraction of this period our coal will be so far exhausted as no longer os vins person our ous win be so in remained as no longer to play a predominant, or over a prominent, part in industrial operations and developments.

What are the facts of the case? Let us take the United

States, where, as your article correctly shows the present rate of depletion is less than for the world as a whole It is utterly meaningless to express life of our cool reas is unvery meaningless to express me of but cot re-sources in terms of such a casual unit is production in 1913 or any other year. For a long series of years the coal consumption in the United States has been doubling approximately every ten years, an annual increase of nearly seven per cent. For the past three years it has been increasing at the rate of 95 per cent per annua. For 1018 the figures thus far published show a mile production in the Eastern District of about 480,000,000 tons and in the United States of about 680,000,000.

If the coal consumption were to continue to increase at the apparently normal rate of seven per cent per annum, and if the proportion of recovery from the mines were as high as two-thirds (considerably higher than has been obtained heretofore) the life of the known coal reserves of one eastern district would be 59 years of the combined eastern, central and southern districts 65 years, of the Latin United States and Alaska over 60 per cent of this supply bring lignites and coals below 60 per cent of this supply bring ignites and coast below the rank of hitumnous, 81 years. These figures are based upon estimates of the Geological Nurvey. They include coal in vente as shallow as 14 in-thes, all coal of up to 30 per cent ash and all known deposits within 0,000 feet of the surface. Obviously on a corresponding bass the life of the coal munable and usable under present

bass the life of the cost munble and usable under present standards would be materially less and the standards would be materially less. These figures bring out, with starting clearnoss the condition which we are facing the innescapable did mine of suncidally rapid exhaustion of our invaluable coal ra-serves or of curvatainent in the growth of our ful con-sumption. If our supply of good, ascessible fuel were manufactured to the contract of the contract of the con-traction of the contract of the contract of the con-traction would not contract to a mean of the consumntion would not continue to increase at the current rate of seven per cent per annum. The time is now upon us, however, when our coal consumption will be ned not merely by our needs but also by the increasing sorreity and expense of the supply The resultant curtailment in the growth of our fuel production will carry with it a concomitant curtailment of our indevelopment, a curtailment which at can be offset only partially by increasing efficiencies and resort to other energy sources. We are using the cream of our resources, and using it too recklessly and too freelfsetently

As your article suggests, the more important immediate conomics seem to be 1. Centralisation of supply of industrial and other

power in huge experitations embodying every practicable measure of efficiency. Industrial power plants and electrical utilities now burn nearly half the coal mined

annually I arge modern central stations have a thermal efficiency of at least four times that of reasonably good is lated industrial plants and further improvement is

2 Location of these super stations at or near the coal mines in order to supersede railroad hauling of coal by electrical transmission of energy over wires. It is estimated that for every hun had tons of coal shipped over railroads, the locometries hading the coal cars burn 10 tons. On a sufficiently large scale the total cost involved in electrical transmission from the mines would be only one-third to on hulf the freight rates on an equivalent amount of cal

3 Fullest possible devel | m nt of water powers within economic limits as to costs. It must be kept in however, that water p wer development is no ea. The available water powers tributary to our great castern and central aidu tual regions can supply only a minor part of our pew i needs at I our main energy source must continue the coal. Water powers energy source must continue to come water powers are in general very expensive unless in nake their development feasible every possible to unsagement in the way of favorable legislation must be afforded as well as comprehensive organisation of power requirements in order to utilise efficiently the scason dly varying water power output

Flectrification of steam rulroads Steam railroads at present consume more than 2 per cent of our cost output. By electrification this would be reduced to

seven per cent or eight per cent

5 Licetrification of coal mining perations particu larly in case of anthracite in: s where a mine usage of 10 per cent of the output could be reduced to 112 per cent by electrifications, representing an effective saving at the present rate of product n of nearly 10 000 000 tons annually

6 Improvement in our \travag intly methods of coal mining Of leposits worked to date been irreparably wasted

The unprovements in practic outlined leaving out The inprovements in panetic outlined leaving out of consideration the use of water power would make available from our present out production more than twice the present useful production more than twice the present useful production from the twice the present useful production that the most of this may actually be realized in the num but future.

The problem of coal supply is fundimental and vital to the future industrial, e admin and general social development of our country. In lustrial civilization development of our country. In instrint contacting depends upon two factors pacer and raw materials but whereas raw materials are will, distributed power sources are not. The nation or people's holding the world's power sources, of which is call is the principal one, control the bases of the wirl is industrial develop. ment Our advanced envilsation out high standards of living depend upon use of power. They could not be supported by what men could be with their physical neth Human labor require power to multiply its cuess. The present high standard of living productiveness. The present high standard of living in the United States is due primarily to our exception in the United States is due primarily to our exception ally high per capits use of p wer. The United States has nearly half of the better grid and more necessible coal deposits of the world it has over half of the total known deposits of coal of all grades. North America has over two-thirds. This m is that to this continuat potential industrial developm at I he extent to which this bounds to be a second to which beneficient bequest, or trust is realized must de pend upon the coonomy and untelligence with which it is administered

### The 50-foot Shin and the 44-foot Canal

R J McCLELLAND

To the Editor of the SCIENTIFIC AMERICAN

I note with much interest v ir issue of 1 chruary 22d I note with muta interest yer issue of LOUMEY 2241 which has on the front cover a good put ture of the 1'w section of the steamer 'Chao R Van Hose on its left on the first lock of the Welliand C unit and on page 17 a short article with reference it this visual and on page 17 a short article with reference it this visual by the United Mi. 3. ments carried out on this yeasel by the United Str. a Shipping Board were of a most anusual nature a a I behere will be of considerable interest to your readers. I am therefore, writing you in the matter thinking that you may care to correct and perhaps amplify somewhat the article in question

The primary purpose of mixing the experiments was to develop a method, which would mixe possible the building on the Great Lakes of large vessels of 10 000 building on the Great Lakes of large vissels of 10000 tons or more. The ship building plants of the Great Lakes have made an envisible record in the construction of cargo slips but because of the small ares of locks between the lakes and the oven they have been able to send out only small ships although they regularly built for work on the lakes some of the largest expresseds. The development of the convey system and

the expansion of our overseas operations developed a constantly increasing denoted for ships of the larger sizes. The Great Lakes with their well organized ship hulding plants located close to our supply of steel could have been of the greatest value if only the limitation of the locks could be av re me

Van Hise experiments devel ped a procedure by which this limit it is cluid be over inc. That this was accompleted in the stress of wir in a period of a relatively few in orther sense is served in a period or relatively few in orther is not service. The Shipping Board deserves much a life for a vering with the work. Mr. Hurles, Mr. Shiyali a life Parajound in authorizing it. It was served at by the Clevel and offic of the United States Shipping, Bord. It is true that I first suggested the plan but ill the congress connected with the Shipping Boarts Clev land office took part in developing it—Mr. H. N. Herraman of Cleveland partin developing it. Mr. H. N. Herram in of Cleveland in particular deserves credit for the success of details of the work and Mr. W. t. 1. wers for the club rate cal. culations which fixed the least one and size of the weights employed to keep the ship stable.
The Van Hise is 50 feet wide and we find that by

this meth d we could certainly take out a ship 5214 feet The widest ship previously taken out is 44 feet the wider supplier rousely taken out a value beam. For the Levinar this in teas may not seem very inpurt int. Int the Van Hiss will carry over 9 000 tans and the largest slip herefore taken out carried only 5 500 t. ns. By building slips for the purpose we are surshed that this method will double the size of slips that in my be passed through the locks.

Practically all cargo ships are wider than they are Prattally an cuse to turn one on he sade and make de y Our problem was to turn one on he sade and make liter stable in that position. Let accomplish this we placed temperary part on tanks made of steel on one sade of her deck. These were so designed that when sake was turned on her sade she would just fit in the locks was tarned on her sad, she would just fit in the locks blue we turn do in hr sad, by samply pumping water into those tanks. She was turned buck by I ting the water run out of them. The tanks were carefully proportioned so that in all positions as she turned she would be stable, that is have a positive mitaentric highly The balance was a delicate one. I apprimists had shown that if the wilgits were not properly identified that the design was the same of the s slup would turn completely over upon her deck

### Finger Print Classification

To the Editor of the SCHNTIFIC AMERICAN In the issue of the SCIENTIFIC AMERICAN published on Ichruary 1st 1919 appears the article linger Print Classification

In this article it states that to those persons who for any reason and a trouble-some to use the old or improved Henry System of finger print identification the writer, 1 H Robinson of Brooklyn N Y suggests the use of the Hollman Notation as adapted to all purposes and being sumple and accurate

a ling this article. I find that all of the ulnur loops will be place I under one primary number and only divided by the ridge counts in the little forger, while in the Henry System these loops are divided into 16 separate divisions making it far easier to search a record by the Henry System than by the Hollman System. Any records which have all whorls would all be filed under one primary number without any secondary classification numbers lie Henry System provided for 81 secondary classification numbers under the primary classification

12 There has been no provision made for approximat ing patterns

I have been in charge of the Identification Office of the Navy the last ten years and am positive that this Hollman System could not be used in a file where there are a million records. It has been the practice of all finger print experts in charge of large Identification Offices to subdivide the files in each and all of the primary and second ary classifications as far as possible in order to expedite the searches The Henry inger print system has been used by the Navy sinc Tinuary 1st, 1907 and has been found to be entirely satisfactory in every particular
By the Hollman System, as I interpret it from the

article all of the impressions in the U group which have

s little linger count of 15 will all be filed together regard loss of whether the loops on the index or middle fingers are mucr or outer. In the primary classification number all of these whorls will fall in the same compartment

regardless of whether the whorls in the index or middle fugers are mucr, meeting or outer
An idea advanced on this line of work must be practical

and not theoretical

### Signaling and Talking Through Space

### A Broad Introduction to the Present Status of Wireless Telegraphy and Telephony

Till recent remail the divelopment of wireless the properties and telephone is estory of cooperative invention. Prince Ancie is nitrate into the world war the various wireless interests were engaged in the usual busines impetition and only too often blocking each others way out the general progress of the radio art by patent highton. One might have a remarkable development on ar existing instrument. but someone had a base pet ut on a teature of that instrument So the man with the improvement was blocked by the basic patent—und the holder of the basic patent—in turn was powerless to improve his instrument because of the blockading patent on the improvement

### A Lesson in Cooperative Invention

Then came the war. The various wireless organiza-tions were called upon to give our fighters the very best to be had in radio instruments. Patriotism and devo tion set uside all commercial and professional rivalry and patents were memeratedly overrated where the interests of our Covernment were occupied. And what counts for more than any other single thing the inventors and engineers of the various radio organizations and the lead ing electrical and telephone companies got together and pooled then idees and exp rience for the common good

point that it is and experience for the common good As might well be expected much ram out of this co-operative work. Indeed, the wireless telephone which but a year or two ago was a delicite innertion child of the laboratory, suddenly developed into a full sized. practical means of communication available for ground use and arresult. Buffling and less in inter for ground use the aircraft that are problems in inter-ference prevention have been more or less solved. Long-distance stations have sublicity become operative under almost dl. (thosphere

conditions. The business capacity of huge stations has been increased many fold The lofty serials formerly required for long distance reception have been abandoned for underground acreals and small loops from three to six feet in diameter, erected four or five feet above the ground it goes with mains other features of wireless which only yesterday were considered the far off goal of wireless man and which today stand practically perfected as a result of unselfish cooperative effort

review of the radio att such as the author would wish to make in order to give the reader a bird seeve we was to speak of what has gone before and since our participation in the war. Volumes could be written on the development within the past year. However it is necessary to assume that the reader is more or less familiar with the broad principles of radio comminication, and has followed the various earlier developments of the art

### Ways New and Old of Generating Radio Waves

Turning first to transmitters we find spark transmitters still employed to a large extent, although many new forms of transuntters have made their appearance now forms of transmitters have most their appearance. On of those is the arc generator which, if not absolutely form of the section of the se odulator of circuits has made it possible to impress telephone conversations on the most powerful are transmitter, thereby making the latter more than ever avail-able for practical wireless telephony

For years wireless engineers have appreciated the con-venience and practiculty of the high frequency siterisator as a means of transmitting. Il were there is a vast difference electrically and mechanically between the generating of currents of 60 or 133 cycles as in commercial power circuits, and the 20 000 cycles required for radio transmission. Still, these cl. tried and mechanical obstacles have been slowly overcome both here and Among others, there has been the Goldschmidt alternator which makes use of cross ingenious winding a home for multiplying the frequency within the machine until radio frequencies are obtained

The Goldschmidt alternator has been in use for some

time past, particularly at Tuckerton, N J, and Ellvese, (actmany, giving excellent results Driven by a 220-volt, 230-horse-power motor at 4,000 revolutions per minute, the Goldsehmidt atternator supplies radio-frequency currents The accuracy of construction of such an alternator is extreme, indeed, the air gap clearetween rotor and stator is but 0.03 lnch, and a

since netween rotor and attack is one to to since, and a deviation from parallelism of one part in a thousand causes the output of the machine to be reduced by one-fifth As far back as 1008, Dr. Fluiost F. W. Alexanderson of Schenectady, N. Y., constructed an alternator delivering approximately two kilowatts of 100,000f-cycle current. The rotor of this alternator made a speed of current The rotur of this alternator made a speed of 20 000 revolutions per minute. In actual speed at the worked on high frequency alternators, and all this work worked on high frequency alternators, and all this work has finally green both to the present successful generators. The advantages of this tipe of generator are numerous. For one thing it gives a steady, uniform supply of radio energy, which only need as to be controlled by telegraph key or mitterpolium amplifying out uit, according to whether telegraphy or telephony is sought

### Telephoning Through 3,200 Miles of Space

Recently Dr. Alexanderson's apparatus was employed by the Navy Department at New Brunswick for transmitting wireless telephone missages to President Wilson on board the transport. George Washington, at Brest Trance or over an air has distance of 3, 200 miles. And

according to this leading radio engineer, this is by no means the limit for wireless telephony, especially when better facilities are availuble

The station at New Brinswick, employ ing Dr Alexanderson's high frequency alter nator, may be used cither for wireless telephone or telegraph messages without alterations, and for simultaneous trans mission and reception of either The 22,000 (yeles, and the only moving part is a solid steel wheel without wires or copper conductors, constituting the rator. This member revolves at 2,100 revolutions per minute The output is 200 kilowatts, and the emitted wireless waves have a clear-out whistle or flute-like sound, with no har-It should be remembered, how

## United States Chemical Warfare Service—II

#### The Great Gas Plant at Edgewood Arsenal With a Capacity of 200 Tons Per Day

Nour issue of March 29th 1919 we dealt with the construction of the great toxic gas plant at Pdgewood Arsenal Maryland where in considerably less than Aresnal Maryland where in considerably less than the week months of active construction we built from the ground up a vest establishment and developed as industry stativity is we to the United States At the signing of the armster I dig wood had a capacity of approximately in one hundred tones of gas per day and by the closs of last year would have been in a position to ship to the front the enormous output of 20 tons of gas between per day and maintain that rate of supply continuously. The significance of this will be appreciated when we hear in mind that the total lails capacity of the German chemi al plants was only all out thirty time per day.
In addition to the manufacture of chloring and mustaid.

gas as described in the procling clapter and massard plant was in a position to produce large quantities of phosque and obbig error it is no made a shall filling plant of large aproxis and a pointer plants for filling hand granteds with both gas and smoke producing materials and for manufacturing incombiney bonds and Also there was built a very fine chemical labormars Asso intervals may not a very fine the measurement above that a description of the measurement and of the different sections of the work wide determined and a large amount of research characteristic of the rottin of the matters were curred on. The work of this kind previous with construction of a laboratory at Edgewood was lone by placing the members of the labor-

atory force in various laboratories throughout the country, and notably at the Bureau of Standards, Washington, Johns Hopkins University, and the Ohio State University

#### The Manufacture of Chlorpicrin

Much was heard during the war of the gases used by the Germans to temperarily blund the enemy by acting vigorously on the tear duets. Ihis was commonly known as 'tear gas'. At allogic was there was built a viry complete plant for the mit ufacture of chloriperan, which not only has a strong lacels under viry complete plant for the mit ufacture of chloriperan, which not only has a strong lacels under viry the stronger explosive of the complete shilled with this gas a i thir a stronger explosive more considerable with the gas a it that the properties of the complete complete the control of the complete complete control and the complete c Much was heard during the war of the gases used by reaction taking place in wrottel true digesters which are furnished with condensors. Stong as the temperature of the fraction romains within the very definite and limited range in which the (bit into in the bleaching powders reacts upon the calcium pirate the reaction takes place very evenly. But if the temperature passes outside of these limits, the 1k aching powder liberates oxygen in place of chlorine and the entire mixture foams

over into the condenser

When the reaction takes plus as intended, the chlorpierm distrib out and is separated from the accompanying

water after being conveyed to settling tanks and allowed to stand in them for a few days. At a plant which the Government employed at Stamford, Com, the pferie acid was produced from phenol and was used directly in making chloryerin. Priere skill for the Edgwood plant was provided from other government plants. Chloryerin was used as a filler for all lunds of projectiles the shells sometimes being filled entirely with helpering had at other times containing a maxime of

chlorpictin and phosgene or stannic chloride

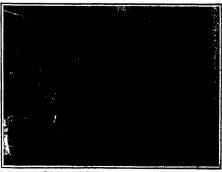

#### The Manufacture of Phos

A most effictive gas, because of its high toxic power, is phosgane, and the plant erected at Edgewood had a capacity at the close of the war of 40 tons per day. Two additional plants were practically completed which would have brought the total capacity at Edgewood up to 80 tons per day. The Covernment was also supplied by a plant operated by the Colbiny Electro-Chemical Co., which made use of the earthou-monocude from its descriptions. co, which make use of the earthon-inconcide from its phosphorous furinaces, and this plant contributed ten tone per day part of the output being loaded into projection at the plant and the rest of it shapped abroad in steel containers. Also a plant at Brook, N. J., was turning out some five tone a day which was shapped in containers to the Allice.

Phosgene has a very strong delaying action upon the heart which may prove fatal even after the first effects seem to have disappeared in the manufacture of

Filling 75-mm shell with mustard gas

the reaction of dicaide and carbon as of oxygen and carbon in a gas er from which pure monozide is obtained e quantities Destruc eratures are avoided by regulating in the process the relative amount used of orever and carbon The pho-

e phosgens plant at wood consuts of a car-

sogewood consens of a car-bon-dioxide plant with a daily capacity of 125,000 edilo feet of carbon-dioxide and an oxygen plant capable of producing 200,000 cubic feet of oxygen every 24 hours s producing 200,000 cubo feet of oxygen every 74 hours four produces gave a total daily output of 400,000 cubic set of carbon-monoxide. The carbon-monoxide and abortise then travel over a sacbron catalyses, and the Bosgene is produced with a tendency to very high mapprentures which is restrained by cooling. The consumers is then liquided by passing it through com-tractions of the contraction of the contraction of the The cuttent of the contraction of the contraction of the The cuttent of the contraction of the contraction of the The cuttent of the contraction of the contraction of the traction of the contraction of the Theorem the contraction of the Theorem the cutter of Theorem the Theorem the cutter of Theo

The output of phospene at Edgewood was used in lang standard shells of all calibers, Livens projector bombs and Stokes mortar bombs Big shipments were made to the Allies in wrought-iron drums or containers, each of which held 1,700 pounds A large group of these is shown in one of the accompany illustrations

#### The Shell-Filling Plant

The shells and bombs for carrying the gas into the enemy's trenches and into the torrain back of his front were shipped to Edgewood from the various shell plants and stored in large dumps, from which they were taken as needed to the shell-filling plant, which was designed for the filling of shells of all calibers from 75 mm designed for the filling of shells of all calibors from 75 mm to 240 mm. In order to make sure that the phosegene was manitained in a liquid condition at atmospheric pressure, the shell-filling plant was equipped with the necessary refrigerating appliances for reducing the temperature of the phosegene and of the shells The shells to be filled were brought by converous through the temperature of many filling the properties of the phosegene was 0°1 and unleaded in the properties of the phosegene was 0°1 and unleaded in the properties of the phosegene was 0°1 and unleaded in the properties of the phosegene propert rooms in which the temperature was 0°1 and unleased in front of the filling machine at a timperature well below the boiling point of the gas. The filling machine of whele we show an illustration is arranged to fill as while as a time and the filling is done within a glass-taclowed cabinet. The liquid phospoon, is divivered by small tubes into containers of the exact capacity of the shells which are filled as at a time. The shells are by tright which are filled six at a time. The shells are brought into the cabinet on a trolley and they are so placed that the heads of the shells register correctly with the outlet. of the flasks above. The cabinct is so urranged that the discharge of the contents of the flasks to the shells can custanger of the contents of the makes of the same can be regulated by an operator outside the calinet and means are provided by which not even a drop of the liquid can fall outside of the shells. The shells are closed by compressed-air motors. As soon as the set of six is filled, the trolley passes out of the cabinet, taking the filled shells with it

The next operation is that of painting the shells with ortain colored bandings which show at a glanc the nature of their contents. Painting and striping were done on an endiese conveyor, which carried the filled shells in front of a nimbr of operators, each of which performed his share of the work. It is needless to say that every part of the plant for shell-hilling was most

Spray-cooling water for the condenser

carefully ventilated, the tul gas being washed in lofty stone-ware towers which are onstructed on the lines of the standard silo

The shell-filling plant has a capacity in 24 hours of filling 80 000 77 mm shells 10 000 4 7 mm, 50,000 155 mm and 4 000 8-moh shells

Charging tanks with phongene gas was hazardous work, calling for gas masks

In conclusion, we wish to as that among the many In conclusion, we what to a left among the many great industrial plants whi is a base of from time to trine we do not recall any offer governmental work which surpasses thus in the in flighest pravious with which it was laid out, the aper lawfit which it was creeted, and the berte period of time in which production on a large scale was accomplished. We wish to re aftern our

conviction that the Govern ment should regard the Ldgewood Arsenal as a great military asset | The cost of a few carctakers would be in significant and we believe that a far sighted policy on part of the Government would see to it that the plant is preserved in such condition that should any future call f : military mobilisation area it could be put into memediate operation

#### Training Field Workers in Eugenics

DIRECTOR C B Davemport of the Fugures Record Office on Long Island, assisted by Dr. H. O. Langhlin, has been giving every summer since 1910 a six-weeks training course for field workers in cugents. The course comprises 25 lectures on human beredity and engenics, with special reference to conduct together with laboratory work on charting family pedigrees tracing the descent and recombination of human traits in pedigrees statistical studies on variation in plants and animals, studies in the elements of biometry tte (linical studies are made at institutions for various types of the socially inadequate

#### Personnel Work of the United States Army

THE principles and methods developed by the Committee on Classification of Personnel in the Army anve occa summarried in an exhibit with its being shown in various cities. At present or up to April 12th the exhibit is at the Lagincering Societies Building 29 West 30th birect New York City I consists of a collection of wall tharts forms photographs and models showing how the Army finds out what kind of work inco. can best do and how it places them on such work in so far as it is needed in the Army how men who claim to have skill in trades essential to the Army are tested to develop the extent of their skill how the intelligence, takent and skill available are distributed throughout the different Army units how officers are classified to ascer tain their special abilities how they are rated for effi-ciency and how this information is used and the general issults of applying modern personnel methods in the

Army during the war The exhibit was prepared by the Adjutant General's office at Washington for the information of officers and eigh as in that city where it regived such favoral is attention that in respons to many a quests the Adjutant attention that in response to many requests are supmand General consented to its display in other cities. Very appropriately it is being shown under the mappers of the United Engineering Secrety representing the four great appropriately teleproper shown under the inspires of the limited Engineering Security representing the four great Linguigency Societies and the National Societies and the National Societies which represents a tief the first successful attempt at instandard, the study on Linguistic Societies and the study of Linguistics of the Societies of the S gation of the relations between employer and employee Over fifty differ at industries in represented in its membership their mutual purpose being to increase the efficiency of the industries of the United States through industrial training and to supplement the edn cational efforts of the Public Schools. The Association, through its various sub-committees, conducts intensive study of all features of employment and training and promentes vigorous activities for the channation of waste through unnecessary labor turnover through lack of proper training and unnecessary sickness and accidents

and past is were maderial far superior to the
methods and past is set in making the size methods
and past is set in making the far superior to the
methods and past is set indicated far superior to the
methods and past is set in maxis and in vogace in the foreign
maxis. It was also received that a spirit of competition
and revalvy shift it in estart to grow up. It was
then free to keep tell and was quite natural that our
than till settle of sour set limition about thereby mass
and the superior that the superior to keep our
shapes up a stell from four far ship is to keep our
shapes up a stell from four far ship is to keep our
shapes up to the far makes to that the work for did would
be the arts contrast if will the work of other naives. In
part of previous of maxis questions of prise and
prestig are meytable factors.

Admiral sims polici s were aimed to cover all of the above, and many other points which always cust in allied joint operations and for which there naturally cannot be any previous training in time of puse. It is perhaps natural that his policies have been misconperiage natural that his policies have been miscon-

strucd by many who were not acquainted fully with the most unusual encurstances of such an impreiedented war

At the very outset he iteaty set forth that the on an and only task confronting our ships was 'to defeat the item's way to defeat this out outstanding aim Questions of pride, presting, relative between the constitution of the item's way to be 'team-work Whorever possible our ships and men were not only to cooperate with the foreign ships and men, but were to consolidate with them

into one team
I xcept where absolutely
necessary, our ships were not
to build up duplicate ad

inmist stave organisations duplicate lines of communication, duplie the supply stations, (i.e. Here was a natural tendeuty to build up our own as parate supporting systems on that whatever show we cutrical into would be our own. The Admiral preached that the best way to win the war was to take conditions as we found them and work with them thereby not only asying great and unincoossity express but also saving long of laws which would be given by the world to the start of we had to wait for this and communications of the start of the

The Administrated at clear to his officers that their game was to avoid delay in litting the entiry and to step at nothing no matter what they had come to behave in the pest which would diminish in any way their throwing their maximum weight into the scales without delay line was time means ever thing. I me as an all-important factor. He this other fellow first—the laster and quicker you defeat his going the sooner the serifies of presons life the west, and expense of war are over. Most earnestly he pointed out that it did not make any difference, what our ships were doong,

IT is not stretching a point foo far to vay that the greatest ally of Germany, during the first four years of the war, was the lack of a unified command among the Alliad armites apposed to her Admirad Sims has sarried the lasting gratitude of the nation at large and his brother officers in particular, because he stood for the closest consolidation under single leadership, and not merely for simple cooperation with our Nual Allies Only thus, as the event has proved could the quick defeat of the submartine, the capture of the High Seas Fleet and the transfer of 2,000,000 American troops to Europe hope been accomplished

what ships they were protecting or where they were working is long as they were hitting, the entern to the best advantage in speeding the day of victor. As to difference in methods and practices, I foreign so were the British service was the principal one concerned simply because it was by far the legislat and hence the one with which our Navy naturally came in the most contact. He mested that it be decided in genural Allied council as to where our ships would be decided in genural Allied council as to where our ships would be decided in genural Allied services.

Admiral constantly directed the point of view of bis officers to the following inneumal Inter. We were gradly outnumbered in ships, mea instead and excry thing else in the game. In excry plane the other Iellow who outnumbered us, had been at it for nearly three long view. In other words we were cuttering a war in it last plane, not in the Examining. He excry quest ned but that many of our net tools and practices were superior to the corresponding ones in the older were superior to the corresponding ones in the older the immortly and the of the claim but be the claim.

Presentation of a parting gift to Admiral Sims in London

adopt our methods or to convert them to our views. The task of persuading the other naives to change their methods would simply savolve fort motion and delay the war was no time to try to cloust nor obligage the other fillow. Hence all of his officers were directed and encouraged regardless of red tape and regulations, to unherstandly drop, for the time lesing, their own could be avoided, and the enemy hit the harder. Of course, 100 per cent efficiency could not be expected. We re we could be avoided, and the enemy hit the harder.

Where a could work our methods in without consequence of delaying the game or easuring fretone—fine—pa shead. In other words, Admiral Banas policy was, that in any game of cooperation, concessions must be made. All parties may be heard at the Countil Table, but when it comes to action one side must give will This is the principle of unified command, later adopted on the Wateria I rout and medicately it is the guiding principle.

recipie of all successful enterprises in cut life.

Admiral Suns prached a do trane easily misconstrued by those, who did not fully understand—but doctrine was that as we were decadedly in the minority, we should be the quicker and show the greater willingness to give way in our arguments and contentions,

and this for the good reason that our sime was not to prove our case, or to prove our superiority in this line or that line, but select you defeat a common ensury. He repeatedly said, "Never maint a but set our sith the war." It is difficult to suplain but nevertheless, only too true, that Admiral buts path, in crisungs that such policies as the above were carried out, was not strewn with rower. It would take a volume of no small size to chronice the troubles that arose or tired to arise, or the obstacles which near the distribution of the property of

Nates declarad war, he stood out for the above policies in all of he work, not only with he own ships, officers and men, but also in his dealings with the breaks and the organizations of foreign navies. In other words he at ourse adopted the policy of numbed command, which latter strated so much world attention whan it was announced as being adopted by the armies in the facility.

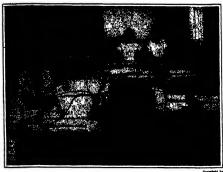

Adhural Suns took the stand in the Allied Council chambers that his forces should be looked upon as reserves being brought up to the 'front.' That where the should go and in what numbers should be determined only after frank discussion by corporate concurred and should be based only on the general and strategical situation and with the sole end in view of sunning the war. This policy is quite opinion of the should be should be soled only on the general and strategical situation and with the sole end in view of sunning the war. This policy is quite opinion at the sole in the s

nations and being separated from its own traditions and methods However, such were the conceptions of our principal naval commander in the war, and who can question the high motives and unselfabness which they

Results only count, and now that the war is over the fact cannot escape that our Navy in the war under the leadership of Admural Bims, has come home with nothing but praise and admaration and respect from the foreign navies with which it has worked Practically no work of the worked Practically no work of the search of the search and the search and the search and the search and the search the search and the search the search and the searc

not to allow these criticisms to interfere with his continuing to be governed by his own convictions based upon his experience.

## British Munitions

A Glimpse at a Picture Too Big for a Single Canvas

By C. H. Claudy, Special Correspondent of the SCHNTIFIC AMERICAN in London

HANGING on the wall of our of a thousand of tag Sir Walter Ralcigh

"Whoseever in writing a modern instory shall follow fruth too near the heels it may haply strike out his teeth

Written in 1614, it has lost none of its potency in 1919, especially to him who would attempt the impossible task esponsity to him who would arrempt the impossible task of painting a true pricting of Grait Britains numbtions work in a single article. The prison twriter needs his subject to the prison of the prison of the many that the prison of the pri

be does not follow? 'I rulk too is not the her is.

To get even a faint did in the program it seems fairly
obvious that one first envisage whit. Mustutous traces
if it ineans guns and shells the narwer is simple—the
Ministry of Musitions will supply no figures until a
peace treatly has been signed. If it means all war maternal, then the pages of one issue of the Nethersit and
AMBRILLAN GOULD find the mere statistics of they were available

The act establishing the Ministry of Ministions was passed on June 9th, 1915 and special powers were con-ferred upon the Minister of Munitions by an Order in Council dated June 16th 1915, the Munit one of War act 1915, and subsequent acts and the Differe of the act 1915, and subsequent at its and the Difface of the Realm acts. Mr. Lloyd (norge took up has work as Minister of Munitions on May 20th, 1915, the nucleus of the new department being formed by the staff of the Cabinet Committee on Munitions together with that of the speeml organization established at the War Office under Lord Kitchener for the development of mu miton supply, known as the Arnamental Output Com-

To these were rapidly added certain older sections of the War Office organisation. This process of trainfer from the War Office was carried durther in ister months, and by the and of 1918 the scope of the department covered the supply of arms, ammunition, explosives, optead munitions, materials, trenth warfare supplies, opaca munitions, materials, trenth warfare supplies, munitions contracts, muutions finance, impection, in vention, dasign and the administration of the Royal Ordanace Factories, these functions being in the main, duties which had formerly been exercised by the War (Man.

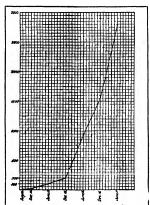

During 1918 the Ministry of Munitions was entrusted

During 1918 the Ministry of Munitions was estrusted with further responsibility for the storage of gun ammunition, supply of tanks, supply of tractors for heavy howtesers, supply of realway materials for the army supply of mechanical transport vehicles, and the supply of chemical glass and laboratory ware. Since December, 1918, these functions have been turber extended to include the highly important department in charge of the supply of heaver-lhain-sail strengt for both land and naval services, as would acknowledge and the Beard of Agriculture Since June, 1917, the

In July 1915 the staff of the Inspections Department in fully 1915 the stall of the Inspections Dispartment consisted of 8 701 persons. In June 1917 it consisted in Lingland of nearly 10 000 with an all-litting staff in the United States of more than 8 000. Women are employed in every possible way. In March 1916, they composed 28 per cent of the staff in June 1917, they composed 61 per cent numbering 20,000 and they are employed on slinost all operations except those in which special technical experience or physical strongth are required

The work of inspection is often very tedious and When it is remembered that there are no monotonous fewer than 183 000 000 separate giging operations for every million rounds of shell it can easily be seen why it requires both many workers and great fidelity to ac

curacy in the work There are in Great Britain-or were at the time of the armstone upwards of 20 MM factors enough in main tions work cellusing. The visit imports of these of course, were private factories operated under street Government control. The Ministry f Munitions has full and country in the first of the course, were to left itself to any factors. take any labor, commandeer any machines or buildings that it meds and it is only fair to say that this enormous power, perhaps greater than that possessed by anceint hings prior to Magna Charter his been used with the single-minded distort to win the war and with a resulting fretion and discutent so small as to be a matter of amount on it to the American observer whose maliciable right it is to grunnlic at his government even when most enthusiastically supporting it M ist important of the factories the factories the national factories. On the 31st of October, (Continued on page 184)

# Mechanical Equipment of the Farm

Latest developments in agricultural machinery and practical suggestions for the farmer

Conducted by HARRY C RAMSOWER Professor of Agricultural Engineering Olivo State University

#### An Acetylene Table Lamp

ACITYIINI has been used for many A source of light for term homes and it has given a high degree, of satisfaction. The homes is piped very much as for natural on artin oil ges and a large-sated ginerator used. Researching the high quality of the acception flame to two minimums have attempted to build a table lamp. The accompanying figure shows one rather successful type. The carbide is contained in the upper chainler and the water in the lawer chamber it being a carbide to water field Granulated carbide is used. The stem of the automatic feed valve is seen

us used. In section in the authorithe lead valve is seen that to the right of the burner tube.

A 3-foot burner is used with this lamp, which burner generates 37-candle power. Burners are designated by the number of cubic feet of gas consumed each hour. With carbide at four cents per pound and kerosene at 12 cents per gallon the cost of operating an acetylene lamp is about 20 per cent more per candle-power-hour than for an ordinary round wick kerosene lamp flame of the activiene lamp is so much better than the flame of a common kerosene lamp that the added cost s of small moment

#### A New Tractor Dynamometer

WITH the rapid development in tractors and tractor tools there has come an increased demand for a machine capable of measuring the pull of the tractor and the draft of other nuplements. There has been a notable lack of experimental work done on the draft of farm machines and one reason for this condition has been the absence of suitable apparatus for performing the work assence of suitable apparatus for performing the work.

A new dynam inter hose just been desgined and put on
the market by a company prominent for years in railway
traction test work. The instrument is
quite complete and buds fair to give a high

degree of satisfaction
This dynamineter makes use of the hydraulic prin tile that is, the pull is measured by the degree of compression of a liquid contained within a vlinder idea is thought to be more reliable than the use of springs of n kind rinother use or springs of a kind of instant. The dynamometer prop is the part which measures the pull is shown in light. I has is list lied between the motive power and the to I being test it. The levis to the right is come to it the jist on in the extender. Under the cys pill there would be some be kage (cf. al. (the higher well as the part) is shown at (2) which is used to return this cil to the cylinder. As the liquid is congressed the force is transmitted through a flexible tube connected to the cylinder at (1) to the recording apparatus lig 2

A table lamp that burns acctylene

A puston (4), by means of a system of levers, further transmits this compression to a pencil (5). This pencil plays over a sheet of paper carried on a large roll motion of the paper being secured by means of a 21-inch wheel running upon the ground. In testing plows this wheel runs in the bottom of the furrow. The pen at (6) draws the soro or datum line and the distance between this line and the mark made by

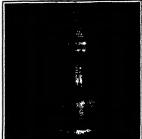

Fig. 1. The dynamometer proper which measures the amount of the pull

the pencil (5) gives a measure of the intensity of the In order to secure the average pull, it is necessary to obtain the area between the zero line and the line described by the moving pencil. This is done by the automatic integrator (7) which makes electrical contact

automate integrator (1) which makes electrical contact through the relay (8) every square inch. The relay closes the circuit operating the pen (9) giving a record on the paper, which record is tallied by the counter (7), so that the total area of the curve may be secured in-stantly at any time during the test

A time clock in connection with the recorder makes A time quok in connection with the seconder makes electrical contact every 10 seconds, thus operating pen (11) which gives a record on the paper at this faterval Pen (12) is operated by a push button and esablies the operator to indicate at any time any portion of the curve which for various reasons should be soluded from the

The results are easily calculated. The area record divided by the proper travel gives the average height of the indicator eard in inches. If this is multiplied by the indicator eard in inches a penul movement of one force necessary to produce a pencil movement of one inch and this by the ratio of the area of the dynaince and this by the ratio of the area of the dyna-mometer piston to the indicator piston, the mean pull in pounds is determined. Having the time record and the rate of travel, the horse-power developed is quickly determined. A continuous record of 5,000 feet can be

To prevent the delicate mechanism of the recording apparatus from accidental injury or from being clouds apparatus from accidental injury or from nemg congave with dirt it is placed in a light motal case, as shown in one of the pictures. The machine can be carried by the convenient handles or may be placed upon the machine being tested. It has an aluminum base,

terrally

which serves to decrease the weight ma

#### Sorghum as a Coloring Material

THE French technical press has lately been full of a very interesting con munication made to the Academy of Sciences by M Piedalu It deals with the utilisation of sorghum as a coloring material The "giumes or husks of sweet sorghum and those of sorghum with black seed hitherto of no use at all, are found to yield a gum with very fine she found to yield a gum with very hine shades of color ranging from pink to bright red, salmon starlet, pearl gray, dark gray, dark gray, and khakt all colors which, being sun and soap-proof are highly suitable for dyeing wood, silk, leather and vogetable fibers. The discovery of than used vogetable fibers the discovery of the new dyeing material it is stated, is one of grad importance, and steps are to be taken. to work it on a large scale

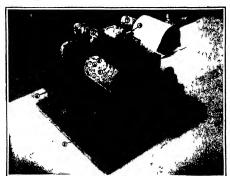

Fig. 2. The apparatus which records the pall

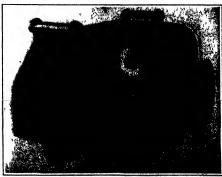

Fig. 3. The recording mechanism enclosed in a diri-proof case

# Inventions New and Interesting

A Department Devoted to Pioneer Work in the Arts

The mechanism that distributes the mixture to the proper height and crewn before tamping

The machine for finishing concrete roads, showing the operation of the tamper

# A Mechanical Finisher for Concrete Roads

A MACHINE which will automatically artike of, tamp and finish the surface of a concrete road has receilly been brought to a point of perfection by a fewering of the surface of a concrete road has receilly been transitioned to a point of perfection by a fewering of the surface of the work of more than a dosen men and do it so that the finished surface is mechanically perfect and free from slatance, sait or light particles which float to the top of the mix of cenent is too wet. One of the chief advantages of the machine as its ability to finish the surface. wet One of the chief advantages of the machine is its ability to finish the surface no matter what consistency of mix is considered to be the best for the particular work in hand. With hand-finishing it is always necessary to employ a slight excess of water but this is detrimental because it reduces the strength of the concrete.
The apparatus consists of a metal

frame work carrying a four-horsepower gasoline engine inside of a protecting shoet metal box in the center. The entire machine moves forward at the rate of seven feet per minute and backs up at the rate of 28 feet a minute by power secured from the gas engine and driving through a system of chains and sprockets to the four wheels on which the apparatus is carried

wheels on which the apparatus is carried. The finishing operation is done in two separate stops and two distinct parts of the machine, the amper and the strike-off to which a left float is also connected. The strike-off apreads the concrete to the necessary height and crown. The tamper, a paddle-like affair is located at the rear of the machine. is located at the rear of the machine between the gasoline engine case and the strike-off board. The first time over, it tamps the concrete with a long, hard stroks. The length of the stroke may be regulated by the operator so that on the second time over, the concrete is subjected to a continuous agitation without exerting any pressure on the mixture This tamping compacts the concrete said trings the air to the surface and tends to bond the stones with just the proper quantity of cement. The final finishing touch done done by the float, a belt attached to the strike-off and moved over the surface to

# Making Smooth Hard Boads with a Snow Refler

ONE of the greatest obstacles to traffic in some of our northern towns is a heavy fall of snow, with no facilities for clearing it eway. Under such circum-

stances vehicles simply flounder around until the ordinary traffic has packed it down. In at least one town, however Laconia, N. H., this difficulty has been overcome by means of a heavy roller which hastens and systematises the hardening process. It is the invention

Don't remove the snow-pack it down hard and go sleigh-riding!

of Charles A I rench the city engineer of Laconia and has been successfully employed for a number of winters

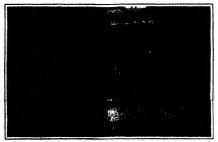

employed for a number of winters.

The roller consists of two cylindrical wooden drums, each 6 feet 4 inches in diameter and 5 feet in length mounted.

The roller is drawn by four or six raca and three or more men are required the persist of one to drive the horses and the three to go she id and showd when I my drifts are encountered. The show it is also level sliding places and chuck

on an oak frame and surmounted by a stat and tool box. Thus the combined

drums give a snow-compacting width of about 12 feet. In Laconia the device is used principally for breaking country and is sent out when there is a fall of four mobes or even loss when at has drifted

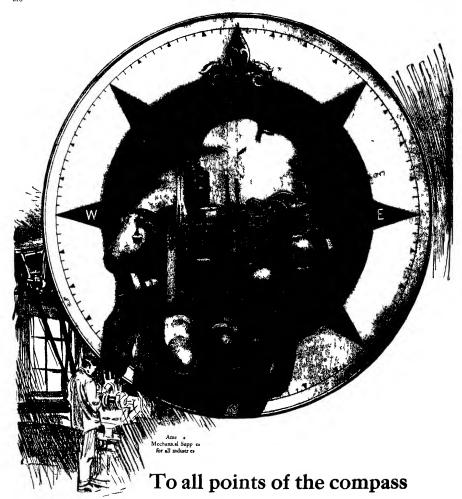

The delousing plant at Camp Devens

holes and when the roller passes over it notes and when the roles passes over its compacts the snow so that it will hold a team and the roads need no more atten-tion until the next storm. So hard is the snow packed down that in the spring when the snow begins to thaw, some of the depart drifts have to be cut out with a road-machine. In the city, after the sidewalks have been cleared by the snow plows the ridge left at the edge of the sidewalk spread over by means of the road machine and then rolled by the snow roller

#### Eliminating the Cooue

THOUSANDS of pedicule restiment and more thousands of pedicule capities drived from the battlefelds and tuchels of burges are the prospective victims of the new del using or coolerate the pedicular of the new del using or coolerate the pedicular of the new del using or coolerate the pedicular of the new del using or coolerate the pedicular of the new del using or coolerate the pedicular of the new del using or coolerate the pedicular of the new del using the pedicular of the new delivery of the new de killing plant established at Cump Devens as part of the Sanitary Pro ess I but As thousands of soldiers will be temobilized during the next few months at Dayons encluding the cutire 26th or Yankee Division of 25 000 mm there will be constant daily use for su h an outfit It is one of the most in ideni of the many inventions evolved by the experts of the United States Army and better than the original crude affairs that were estab-

France Germany Russis and Serbin All returning soldiers from the trans-ports that will diek in Boston will be sent to Camp Devens for demobilization after to camp bevens in demonitzation inter-thorough quarantine which includes the delousing process. I very sidder his to disrobe. His clothing and his belongings are all thrown into his barracks bag. are all thrown into his birricks bag. The cooles get it either way whether they must on strying with the solder or with his effects. With the former they will be scalded to death or dr win d out for the solder has to undergo a hot shower bath with plenty of so ap. With the clothing they will be scalded by live The clothing and the effects in the barracks bags are thrown into a huge exhindrical wire busket shown at the left of the picture — It accommodates 70 bags Once filled the basket is rolled to the death chamber said chamber being a long steel tube connected up with pipe supplying hye steam. The basket and its contents are scaled up inside the tube by huge stret doors and the steam is turned on for forty minutes After this the basket ior forty minutes. After this the basket is removed for the contents to cool. The bags full of clothing and other impediments of a soldier are delivered to him dry but still warm—slightly wrinkled. and shrunken, perhaps but clean

POR many years The Fairbanks Company has satisfact r ly served Purchasing Departments r the ent re in lustrial field—such purchasers as mills factories m nes railroads and steamship lines

Branch Houses are ma neared in principal cities In each of these Branch H uses an immense range of products together with efficient auto truck service is sures prompt deliveries The individual Branches have complete facilities for any needed after service. No similar house has won the world wide standing enjoyed by The Fairbanks Company

MOST people know Fairbanks Scales But it is not generally understood that The Fairbanks Company also markets Mill Supplies, Valves, Machine Tools,

Transmission Trucks and Wheelbarrows Engines and Pumps, and other mechanical products of a quality which entitles them to bear The Fairbanks Company O K

Fo carry on this work, The Fairbanks Company, as stated above, now maintains 22 Branch Houses in leading American cities. Here business is done both at wholesale and rettal. In addition, prominent dealers in other cities handle many of the Fairbanks products.

Foreign Branch Houses are maintained in London, Glasgow, Paris and Havana Resident representatives cover the prin cipal commercial countries of the world

The Fairbanks Company maintains a staff of experienced buyers who give our customers the benefit of volume buying A force of 400 traveling salesmen, trained in mechanical lines, adds to the service

PURCHASING agents buy in two ways Orders may be scattered among many sources of supply, or the buyer may find all or a large part of his requirements met by The Pairbanks Company In centralizing his buying with The Fairbanks Comp uny the purchasing agent is in effect dealig with a Mechanical Supplies Department Store He orders all he needs from one holl and delivered nearly always in one shipment. Thus complications are taken out of buying bookkeeping and handling

Customers also turn to The Fairbanks Company because

- ( ) Here they fi d he best in M II Supplies Valves Scales Ingres and Pumps Traisn soon Machine Too's Irucks Wheelbarr wa and other me ha al supplies
- (2) They secure p mpt deliveries—insured by immense s o ks and motor truck service
- (3) They fid pre rgh
- (4) The purchaser ur her benefits by the thor oughly equipted Service Stations which are maintained nieurit if the Branch Houses

A call in person or by telephone at our nearest Branch House will pu you in touch with right hand service, which every Purchasing Department needs!

#### The Biggest Car Dumper in the World

(Continued fr m swar 808) ti insfer their weight to the vertical part of It was necessary, therefore, to the crude It was nece cut the platform in two

cut the platform in two
the overturing of a hig leaded ear in a
modern American dumper is an interesting
thing mechanically. The platform and
cradic together with the ear, are to be
turned through an angle almost equal to
180 degrees. It is not proposed to let
anything also except the coal. Accordmally the arrangements will need to a
unit not though the car squaresty against its
trick with enough forces to hold car and
construction of the car and the construction of the construct are several steel construction concerns which build dumpers, so that naturally there will be variations in minor points In a representative case, the procedure will conform substantially to the following

platform in place, but not with sufficient force to prevent the overturn olamps and four ropes, distributed as suitable intervals along a cer, the vestigation provided takes care of the whole length of car. Naturally, as the loaded cepts overturned and in nonequence leans sieves and car Naturally, as the loaded very turned and in honsequence leans siere and more out of the dumper tower, the ropes keep them sternly to their duty. clamps and ropes interfere inappreciably with the discharge of the coal

The clamps the inselves are simple affairs There is the crossbar already mentioned On one end is a long rod set at right angles When the loaded car is riding and the clamps are in position, these rods will extend vertically downward and pass loosely through holes arranged in the floor of the cradle When the cradle returns with the empty car, the lower ends of these rods will encounter fixed rests The effect then is that the car goes on down and leaves the clamps standing in a row with their horizontal arms at a suitable distance above the car and extending well over its

As the loaded our goes up it meets the clamps and carries them along into position to receive the corresponding ropes when the overturn begins. The ropes lifting the cradic bring it up against a resistance which turns out to be in effect ropes continue their action, their pull is, by the pivots converted into an overturning movement

At Sewell's Point the deck of the pier grouper a grout clevation being necessary to provide on the and for the gravity discharge of coal from pockets or bunkers arranged beneath to the made it necessary to provide for getting the coal to the deck in some kind of rolling the coal to the deck in some kind of folling stock Spicial pier cars of 120 tons ca-pacity the largest cars of the kind in existence—are provided for the purpose They receive their loads from a dumper and then pass the two routes to the pier dick ()ne route leads up to a long incline deck. One rutte kads up to a long melne-to the pier dock and is accomplished with the aid of a byrney operated by cable. The second rutte leads to the foct of the eleva-tor framework. Here the loaded car passes to the alevator platform and is hearted vertically a distance of about 67 the pier deck tuder its own power and dilivers its load whi rever wanted. The second uper car is needed because it is get special pier car is needed because it is self cleaning the railroad car is not On the cleaning the railroad car is not to the pier, it is necessary to dump through the bottom. The road cars would fail here where at the dumper they do not fail because of their more nearly complete overturn

Of course, there is no such thing as perpetual motion in the sense that power ean be delivered without a correspo receipt of power from some source receipt of power from some source. How-wer, there is such a thing as the ad-vantageous distribution of power. At the foot of the elevator, the loaded puer car weighs, with its load, well over 400 000 pounds.

The platform and adjuncts used to raise

In a representative case, the procedure will conform substantially to the following account. The platform and adjuncts used to raise will conform substantially to the following and lower cars add considerably to this accomplished by means of such that the power plant is a substantially to the car and platform is also accomplished by means of raise in the platform is also accomplished by means of raise in the platform is also accomplished by means of raise in the platform is also accomplished by means of raise in the platform is also accomplished by means of raise in the power plant has less that a group of ropes will number, say, equalised, however, on the down-traptor unan ordinary but installation. At the power plant now has work to do, since well a Point, the big two-car dumper has a trip for the cach car. The rope relating car and platform do not come in all the overself of the counter weight four to each car. The rope relating car and platform do not come in all the overself of the counter weight has been proved in the car. A loose clamp is the time of the counter with the car. A loose clamp is but little difference between an upper suiterposed, consisting musty of a bar and a down-trip. The result is the perwinch structure and the power plant is not adjusted by the counter of the counter with the car. A loose clamp is but little difference between an upper suiterposed, consisting musty of a bar and a down-trip. The result is the perwinch structure and the power consumption is a bounded by the counter with the car. A loose clamp is but little difference between an upper suiterposed, consisting musty of a bar and a down-trip. The result is the perwinched that the power consumption is a but that difference between an upper suiterposed, the power consumption is but little difference between an upper suiterposed, the power constitution of the counter with the power constitution of th and lower cars add considerably to this

# PATENTS

YOU HAVE AN INVENTION which you want to patent you can write fully and freely to Munn & Oo for advice in regard to the best way of obtaining protection Please send sketches or a model of your in vention and a description of the device, explaining its operation

cevice, explaining its operation.
All communications are strictly confidential. Our vast practice, extending over a period of sevenity years, enables us in many cases to advise in regard to patentiability without any expense to the filont. Our Hand-Book on Patentia is sent free on request. This explains our methods, rms, etc., in regard to Patenta, rede Marin, Fereign Patenta, etc.

## WANTED

MUNN & CO desires to secure a competent Patent Rollector familiar with the preparation and processuation of chemical and mechanical cases Address all replies to O D. Munn, 253 Broadway, New York City.

#### LEGAL NOTICES | Signaling and Talking Through Space ued from page 871)

distance of 3,600 miles, and to Hoxelulu Hawaii, about 7 000 miles! A large battery of vacuum tubes, arranged as generators and others arranged as modulators, were employed in these long-distance tests. The vacuum tube in its present form is made in various designs, although funda-

mentally it consists of one or more filaments which can be heated to any degree and two or more electrodes. The theory of what takes place within the bulb is complicated hence must be avaded here for lack of space However the present vacuum tube is available as a dete tor of wireless signals and wireless telephone waves as a modu and wireless telephone waves as a moud lator or relay as an amplifier or builder of weak currents to powerful currents, and as a generator of alternating currents of a wide range of frequencies

# Electric Lampe Which Have Made Wireless Telephony Practical

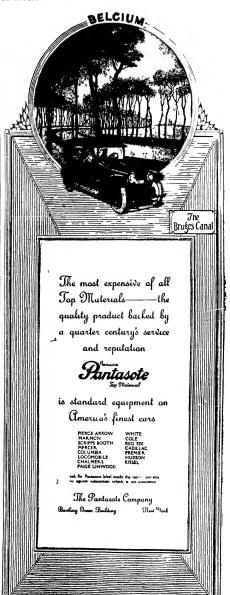

Given a perfect amplifier and a perfect includator, the problem of radio telephony is solved at least theoretically for all that is necessary is to modulate the output of an oscillating circuit and then if necessary amplify the modulate l current to any degree in order to obtain a sufficient volume of current in the serial for transmission through space Or one may first generate oscillations of large power and modulate them by means of the amphified output of the telephone transmitter. That is of the tecpnone transmitter rame is why with the perfected vacuum tube wireless telephony was practically per fected overnight. It became possible to telephone from simplanes to the ground and vice versa to telephone over land lines to a wireless station, which in turn sent out the conversation to a battleship or steamer, and to receive the answers back through the wireless station and land lines through the wireless station and land lines, and to telephone through space many thousands of miles Of course many details had to be solved. The noises of the arplane had to be contended with, by the devicipment of special ear process and helmots, as well as by special transmitters which would respond to the v-toe and not which would respond to the value and not to the extraneous sounds And with our Army and Navy in need of thousands of bulbs a week, the design and manufacturing methods had to be aftered so as to permit of quantity production
Like nothing else the vacuum bulb arrowed the greatest annels contributor to

proved the greatest single contributor to wireless communication Quite appro-priately it has been referred to as the modern Alladin s lamp

Thanks to the sensitiveness of the vacuum tube as a wireless wave detector, and then to its amplifying properties which make it possible to build the which make it possible to build the weakest currents up to any volume without distortion serials for receiving purposes have begun to shrink to amal proportions. This is that become possible to make use of exceptionally small serials and even burned serials. Indeed, James H. Ropers of Hysteville, Md., has developed as interesting form of underground wire-terms of the series of possible for submarines to receive wireless messages over great ranges without company up to the surface incidentally, this system, it is understood, practically climinates static—which is the free elec-tricity due to atmospheric conditions— as well as interference from undearable stations.

# Receiving Thousands of Miles with a Three foot Wire Loop

Another recent development in wirele Another recent development in wireless reception is the use of a simple loop serial, say three to six feet in diameter, with which it is possible to receive waves from which it is possible to receive waves from stations thousands of miles away, provided proper apparatus is employed. In fact, it is stated on good authority that within a year a loop serial will permit an amatetic to receive signals from almost all over the words. And the loop, most ramarkable of all, cas be used indoors. However, for

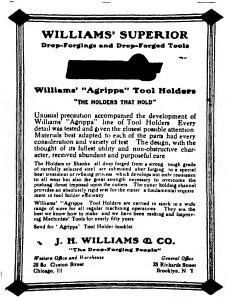

40.40

BUILD NOW! Build the Bossert way

LOUIS BOSSERT & SONS, Inc., 1305 GrandSt., Breeklyn, N.Y.

emicut is as positioning in the proper plant s as to intercept the waves to the best add intig. The loop is employed on certain Arms and Navy plants for the purps is a considerable for the pilot by manerity sing albut until he receives the loudest signals from a ground station to locate it direction of the station. The loop n that ease is generally incor-

How the I mied States Government kept m tou | with our forces and diplomate oversus is one of the most interesting storics of insiders radio communication Indeed early in the war information was received their the Germans were making received that the Germans were making of the eathers or perations for the entiring of the cables for the purpose of interrupting our communication with Lurope and this fact in or than any other gave a tremendous min tusto wireless. As it was three cables are a superior of the cables were actually interrupted, and excapies were actually interrupted, and ex-cellent evidence is at hand that enemy in-fluences were responsible. Wireless tele-graphy was called upon to assume only part of the burden of cable traffic, which often aggregated 200 000 words in each direction per day and at no time was the radic service worked to full capacity

It is from a little room in the new Navy Building at Washington, D. C., that all our trans Atlantic radio traffic is handled The Naty operates four powerful stations
—Annapolis Md New Brunswick N J,
Sayvilli I and Tuckerton, N J
The Annapolis station, with its four
Gol-fout I we is a believed to be the most
powerful station in the world It has powerful station in the world It line a 350 kilowatt transmitter The New Brunswink luckerton, and Sayville stations are rated at 200 kilowatts each, tions are rated at 200 kilowatts each, All these stations are operated from Wash-ington by means of land lines. Whereas other governments operate their wireless

other governments operate their wireless stations at the very base of the lofty puwers we have gone a step ahead of them by centralising our stations in our Capital. There are four tables in the trained one of the four stations. On each table their are two ordinary telegraph keys, one of which is directly connected by heavy land cable with the transmitter at its respective station. The operator, sitting at Washington operator in the transmitter gat Washington operator in the transmitter without the vivies of another operator. The other key serves to telegraph any instructions as to the manupulation of the structions as to the manipulation of the transmitting equipment

# Operating a Wireless Station from a Distant Point

Lach operator wears a pair of telephone receivers which enables him to hear the signals from the transmitting station which signals from the transmitting station which he is operating. The receiving aerial is errited on the roof of the Navy Building at Washington carefully attuned to the wireless stations to which it belongs. One table operates the New Brunswick station, whi h may be working with the steamer Grorge Washington The second operates the Annapolis station, which may be working with Lyons, in France Ordinarily the New Brunswick station also the Managhoi station, which may be be the groun and shalls in which such great the Annapolis station, which may be be the groun and shalls in which such great the New Brunsweit station that the New Brunsweit station that the Managhoi station of the Station on the Station of Station Station of the Station on the Station on the Station of the Station Sta opp the with Lyons, mauring two traffic lines instead of one. The third table operate Sayville, which may be working with the station on top of Admiral Sines a office in London. Incherton is operated from the fourth table, and may be used for keeping in touch with Rome or other Luropean capitals and centers Most working at once, yet there is no inter-ference because of the perfect syntony or tune of the transmitters and receivers

acruais a c not going to disappear so soon, in annipulating a keyboard. The paper because 1 is mostly the reception of inectape, in turn, can be resided through a sages which items it said to burned acruais and I spis. What makes the loop as 100 words per munite, as compared with effects it is it posttoming in the proper the usual 28 words a minute of hand aloo words per munte, as compared with the usual 25 words a minute of hand winding At the receiving end, aspecial photographic form of recorder, which comploys the string galvanometer and a beam of light principle, records the high spend messages on a tape which can be decoded in the operators own good time

It has been said of aviation that the war gave it at least a 10-year gain in develop-ment and application But in this respect aviation is not unique, for, to all app ances, American radio communication has made an equal advance as a result of serving its country and the Allied cause

#### Admiral Sims in the Team-Work for Victory

(Cuntinued from page 874)

As to our forces serving under foreign commands, one has but to stop and think of the tables reversed, with foreign navies of the tables reversed, with foreign navies coming over to operate from our ports, and with our Navy from our shores and imagine our Navy relatively higger than the other navies, as our s was relatively smaller in this war. Wherever our ships were allorated they found already existing a large number of ships with large bases and supply systems and complicated extensives. and expansive communication system

It would have been nothing but ridiou-lous to have insisted upon any of our officers relieving the senior foreign officers in command of these stations from which our ships were to operate, commanders who had been carrying on their duties for three previous years of the war As a matter of fact, Admiral Sims never questioned as to who was to command, that is, whether a foreigner or an American, he merely assumed that the senior man on the spot who should naturally, owing to experience be the best man, would, of course, command our ships when they joined his ships

#### **British Munitions**

(Continued from page 375)

1918, there were 198 of these operated by the Ministry of Munitions — First were the four Royal Factories, engaged in producing four Royal Factories, engaged in producing ordnance, guspowder small arms and air-craft Then there were 46 explosive and propellant factories, 22 filling factories where women a hands filled shells to shoot Huns 13 projectile factories, 40 shell Huns 13 projectile factories, 40 shell factories, nine ammunition component factories, neven tool and gage factories, 28 hox factories and saw mills, eight air-oraft factories, four steel works and rolling mills, 10 ordnance factories, three small arms ammunition factories and four missedlaneous factories

These plants, many of them starting small, often grew to tremendous propor-tions In the great arsenal at Woolwich tions In the great arsenal at Woolwich a rapid growth took place, typical of all. To it, England is indebted for almost all kinds of munitions and for the performance of work of the most highly-specialised and of work of the most nighty-specialized and skilled character including the preparation of drawings, specifications and the work-ing out of the details of the new types of both guns and shells in which such great

or tum of the transmitters and receiver [actor, in the decision to establish and in order to speed up traffic, especially logicate a Ministry of Munitions factory, in the case of press despetches and similar As an example of economy, a group of volumenous matter, the radio messages TAT factories within have been operating are sent by means of perforated paper for the longest period required a explicit aper An operator, sutting before a machine which recembles nothing so much as a capacity which has already psedioced extraording to the contract a paper trap by!

# Pierce-Arrows ready now for peace needs

THE needs of war required no change in the design of Pierce-Arrow trucks. The same models that solved transportation problems in 148 different lines of business before the war solved also the more difficult problems of war transportation.

This uninterrupted succession of Pierce-Arrow trucks is available now to continue your

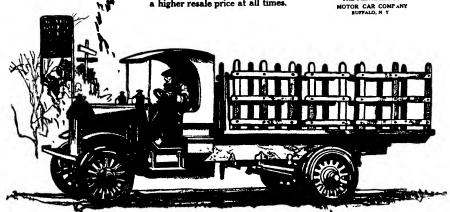

high speed production and carry your product to waiting markets.

Our experience and the records of Pierce-Arrow performance, complete and convincing, are at your service. With trucks for immediate delivery, we are ready to assist in the reconstruction of American business along peace lines.

# PIERCE-ARROW

Delivers more work in a given time;
Loses less time on the job and off the job;
Costs less to operate and less to maintain;
Lasts longer, depreciates less and commands
a higher resale price at all times.

#### British Munitions (Continued from page 224)

ploaves at a cost of \$17,500,000 which, at the ontract prices being paid when the factory was under construction would have at I ngland \$35,000,000

The cost of production of TNT at Queensferry in 1917 exclusive of interest and am ritration was about 17 cents per pound. The cost in the market when this fact 1y was started was about 43 cents per poind

Because the war is not yet ended, the Ministry of Munitions is giving out few if any figures on the amounts of anything suppli | But percentages are of little use t the cancing and they are available to use i in Cours and they are available to some (\cappa if for instance the production of mirjims by the end of the war had grown to over 700 per cent of what it was at the beginning Arplane factories turied at in a week at the time of the armist o more planes than the whole country produced in the entire year of 1914 in a 1 nth more planes than the ontire produ it n of 1915 and in three months more planes than the entire production of 1916

In meline-gun industry increased by 3 700 ; r cent Eighteen pound shells wer tiried out to the tune of 900 per cent

wer timed out to the fune of 900 per cent at it trunslere against one per cent in August 1911 and so the sterv runs.

In to the warfart supply department han it is unorm use variety of supplies from funes also helmets shelds specialized chemical apparatus (ronch under the period of specialize to common apparatus continuor tus and their ammunition. This depir is it is ipplied 1 500 000 steel helmets is one period of six months. In De cult r 1316 the tennage requirements. amounted t 7 648 tons, while in June 1917 they reached 17 963 tons

1017 the reached 17 903 tons
In March 1017, the high explosive output was four times greater than in March
1015 During the war the optical output
of Ingland which country had previously
depend of as had we, largely upon German, for glass and mathematical instruing its light increased by 2 000 per cent

It has all been done at a tremendous The national munitions factories cos-Cerants of more than \$80,000 000 have been made to private firms besides a similar sum in buildings, tools, plants etc., handed over to private firms by the Ministry, that they might work the faster and the better National arsenals increased from three to more than 200 -of what use to continue isolated figures? Fingland jumped into the war with both feet and when she set her self to make her armes the best equipped and the mast efficiently provided in the field she did it whole heartedly, single-heartedly absolutely regardless of any other con-uderation. We in the United States are proud to think of what we did in a year, but sending two million men abroad from a population of 110 000,000, big feat as it is does not bulk so large against putting an arm; of 7 000,000 in the field from a population of 40 or 50 million and in addition to supplying them supplying allies including United States troops, with much of what they fired and much of what they fired from

This may not be the place to speak of the women's part in munitions work—it properly belongs, doubtless, in a story on labor but it should never be forgotten that at the time the armistice was signed nine-lenths of the total shell output was the work of women who prior to the war never even saw a belt, a lathe, a tool or wore on ralls

It is with some timidity that the matter It is with some timulity that the matter of labor statustics in munitons work are approached. They differ so—they so contradit cash other! One department says roundly that three million people are employed in making munitions. Another says it is two millions. Both are probably right, the larger figure including all civilian workers on war work, the smaller referring in

only to those supplies governmentally classed as munitions, and perhaps excluding Admiralty laborers. However there is one set of figures which comes iresh from the Ministry of Ministers which ought to be authentic, and which because it illustrates so wonderfully the growth of the trates so wonderfully the growth of the munitions industry, one is kimpted to give in full and in tubular form. Only no one reads tables of figures, so the table is comutted and the attempt made here to force the reads; to absorb the story the numbers tell by as it were sneaking them past his vigilancel

In the beginning of the second quarter of the year 1915 which means of course six months after war was declared, the government here had employed in both governmental and private establishments in the metal, chemical, explosives and rubber trades but not including the Ad muralty workers, not quite 600 000 people marsty workers, not quite 600 000 people in about the proportions of eight men to one woman. In sax months more, or by feetber, 1915 the total was 1,003,000 but the women had almost doubled in numbers. By the end of the following year there wer. 16-4,000 of these maintions workers, of which 818,000 were women more than six times as many as were at work 18 months previously And on October 1st 1918 just before the armsitie supplies were turned out by 2 049 000 munitions worlds of which more than a third were women 1 419,000 men and 730 000 women Plane note carefully that there me not figures of either women or men corders workers in England but exclusive of the thousands on trains, tram farms and in civilian factories. The Ministry of Munitions confesses to have no very exact figures for 1914, but estimates that before the war al out 50 000 men and practically no women thid munitions work Great Britain will not be entirely without

material reward No one here thinks any sacrifice has been too great any bard ship worth mentioning any dislocation of tradition too severe to undergo, now that Germany has been definitely brought to her knees and the war won. One hears no complaint no monning no expression of regret that the right little island has been turned wrongside out and upside down socially politically and upside flown socially politically economically to get on with the war to carry on to the successful accomplish night but when at last the war disloca-tion is rest, England may well look to some of the fruits of her munitions work with a feeling that at least there is no great loss without some compensatory small gain. For metance, as a direct result of munitions campaign. Great Britain can now claim first place in the electrical in dustry, over Germany and Austria she can do on many accounts, but on none she can no on many accounts, but on non-more than on the production of man India produces 50 per cent, (anada 15 per cent and what was German 1 as Africa 10 per cent of the world's supply And now Indian mita can be exported

from that country only to London! England now produces all the high speed tungsten steel she needs In pre-war days the Critical Emigroum produced no ferrochrome, needed for certain steels Now one factory, driven he waste gas from coke ovens in a quite American-utilization-of-waste-product manner, produces enough to meet all the requirements of the kingdom. In pre-war days the United Kingdom used some 240,000 tons of spelter annually, of which 77 per cent was imported from Germany, Belgium and Holland The Australian concentrates are now, of course diverted from Germany to the United Lingdom, with the result that the sinc smelters are trebling in sise Prior to 1914, 30,000 tons of potash were Prior to 1914, 30,000 tons of potsals were imported annually, principally from the Stassfurt mines. But England discovered she had 50,000 tons going to waste in dust and fumes from blast furnaces, and hearly 20,000 tons annually are now being re-covered and there is more on the way. England has learned a great many things

about factory work she never knew, or if she knew, would not use, before The mechanical conveyor, the electric truck and trailer, the shop sled, the standardised output the health and condition inspection for workers, are cases in point—not that she did not know of them in pre-war days but that they were not universalas they now are

One feels totally inadequate to under-stand, let alone describe, a munition program which has been as immense at home as the armies in the field which demanded it have been immense abroad But one looks at a figure here, a picture there, a worker in overalls trundling a truck of shells who should be trundling a babyone sees old men, crippled men, men in ill health all with a smile, making shells and guns one sees workmen to whom the church in veneration, working hours the cauren in veneration, working nours the trade minim never sanctioned, side by side with lilates" and girls and doing it willingly to get on with the war"—one sees long factories built where were fields and puks and waste spaces, enormous structed almost overnight, and one sweeps one s hat from one s head in hearty admirate n and a little awe—even if he comes from a country where such things are commonly done as a part of the romance of industry at the spirit, the courage and the single minde ness which 'carried on such a successful and such a magnificent

#### Substitutes for Belting in Germany

I ACK of leather for driving-belts and of oil for lubrication caused the Girmans to invent curious substitutes, according to the War Frade Intelligence Department of (nest Britain, which has been investi, iting the enemy's secrets Belts were found that had been made of paper tissue or hur varn

If very strong yarn was used in chainstitch only one layer was required, whereas weaker yarn had to be twisted together in severd layers It was advisable to edge the belt with leather or tin, otherwise the

edges were away rapidly
Driving belts made of tissues sewed together or colled inside one another were together or tolled made one another were executingly restant and stronger in the edges. The friction was slight and they could in mended easily. This kind was made modelly of spun flax, hemp, or paper yarn. Those of the last kind, which were plainted on kinted, had no transversal threads which serve to make the edges extensive. atrong

Cellulose material was used for medium sized muhinery, but care had to be taken in putting them on, and not to pull them too tight for they could not resist much The varn belts were also woven or knitted in tube form which was flattened out afterward and sewed together, cotton or pup: was used mostly in such cases They proved very useful substitutes for leather

The Lextilose-Enata belts consisted of equiately twisted jute or cotton threads They proved to have great flexibility and clasticity, each fiber bore a part of the tension and there was no giving away at

The former rubber and balata bolts have given place to ones of substitute rubber. The newer material proved to resist melting when heat was caused by fraction | I be main drawback was that it could not stand much tension

could not atand much tenson
At the Lenpuc exhibition a new belt was
shown comprising the following. The chain
made of horse-hair or wire, the cross
thread of idd cotton, typha, or peat filter,
the belt so formed being thickened with
tar | hose driving belts were only supplied tail in exchange for a form testifying to the need of them

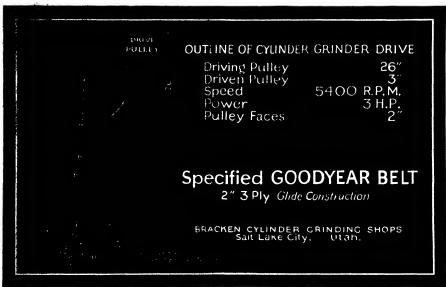

to the need of them.
In a wood weaving works, it was reported,
the thick canvas driving belts, which
substituted leather ones, had been found
satisfactory since they did not suffer any
more breakages than leather. However,
they could not be renaired so often.

# High Speed Grinding—and the G.T.M.

Henry L. Bracken in Salt Lake City used to have what he called a champion belt eater. It was a high-speed cylinder grinder with an old style drive. It cost a hundred dollars a year to keep that one little machine belted. The highest priced belts lasted only six or seven weeks—some only two weeks. As soon as their joints went bad, the belts were practically done; for the mile-a-minute speed of that drive and the reverse over an idler, made durable repairs almost impossible. Occasionally the joints did hold and those were the times when six or seven weeks' service was obtained.

One day our Mr. Le Masters, a G. T. M.—Goodyear Technical Man—called and explained to Mr. Bracken the Goodyear idea of selling belts to meet conditions and not as a hardware man sells nails. He explained the Goodyear Plan of accurate diagnosis of all drive conditions before prescribing the proper Goodyear Belt. Mr. Bracken listened, felt he couldn't possibly do any worse than be was doing, and took Mr. Le Masters to his belt-devouring cylinder grinder.

The G. T. M. studied the drive, measured the pulleys, measured the speed—and then studied the pulley faces carefully. He found that they were the kind that Glide Belting is especially designed to serve—so all that remained of his problem was the length, the width and the number

of plies. He prescribed these to fit the conditions and Mr. Bracken signed the order for a Goodyear Glide Belt, costing much less than the kind he had been using. The belt came and, of course, didn't have to wait long. It was installed November 18th. It has outlasted every other belt and at the time this advertisement goes to press, it is still running

The G. T.M.'s service and Goodyear Belting have done more than cut belting costs. The grinder runs more quietly, does better work, is much easier on bearings, and according to Mr. Bracken is like a different machine. He has since had the proper Goodyear Belts installed on all grinding spindles.

If you have a belt-devouring drive that is eating too many dollars, ask a C. T. M. to call. He'll do it without charge when next he is in your vicinity. There are many of them—all trained in the Goodyear Technical School—all with experience in plants similar to yours—all selling belts to meet conditions and not as a grocer sells sugar. The C. T. M.'s services are free simply because the savings they effect for purchasers are so considerable that a gratifying volume of business from the plants served is certain to come to us within a few years.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

The man who owns a GMC Motor Truck may well look upon it with the same degree of confidence he once placed in its predecessor the horse his faithful friend

Whether it be a single GMC Truck or a fleet the owner finds untold satisfaction in his confidence that his work will be well done

During the years since GMC Trucks were put on the market there has grown up among GMC owners everywhere just such a feeling

Trucks from the very first were built to be inherently good Good for their own sake

No GMC Truck was ever built to meet a price

The GMC ideal has been to build the best truck possible in a particular size, for a particular kind of work

That is why, as a result of proof of performance the reputation of GMC Trucks for rehability and plain honest quality is rapidly growing

# SCIENTIFIC AMERICAN

#### IDEALS can be transformed into service

- and service - performance - is what you want and must have when you buy a motor truck

The DIAMOND T MOTOR CAR COMPANY a little over a decade ago began in the mind of the president of the Company, with little money and a big ideal

It is now one of the largest plants in the country devoted exclusively to making motor trucks

# DIAMOND T THE NATION'S FREIGHT CAR

The original "little money is now a great deal of money,

—and the present ideal is the very same ideal that the Company began with

The original ideal was (and is) this to build a motor truck that will give a service equal to, or better than the best

—and to keep down the production cost and the selling price, by eliminating expensive non-essentials and un-

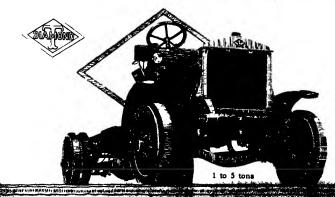

certain experiments

That ideal is realized in the DIAMOND T

# It picks your pocket while you took on!

The last pre-war figures show America's fire loss at the astounding figure of \$2.10 per person per year. This is what you and everyone else in America paid to fire in 1913—four times as much as the Frenchman paid, seven times more than the Englishman and far more than in any other country investigated.

If this tax you pay to fire earned you immunity from it, perhaps the cost would be justified.

But fire grants no such stay—its threat is omni-present. Conflagrations still rage particularly in America where its toll is greatest.

We have built our towns in a hurry and in the haste have overlooked the fact that "fireprocided" to have proper emphasis should be read "firep-rocfed." For the easy path for fire through a community is across that community's roofs. Not always are roofs the kindling point but invariably they mark its course—unless they are built to repel fire.

In Johns-Manville Asbestos Roofing lies the answer to both community and personal fire safety. For in this fire-safe roofing, adaptable alike to factory or home, warehouse or public building, is nature's rock-like fibre, Asbestos—that repels fire, limits its destruction and protects your property.

It is of first and vital importance that you protect your own property against fire loss because this self-protection when taken collectively means the fire safety of America.

There is a Johns-Manville Asbestos Roofing on this list that on your building will protect you from fire's scourge.

Johns-Manville Asbestos Roofings: Asbestos Built-Up Roofing; Asbestos Ready Roofing; Corrugated Asbestos Roofing; Colorblande Shingles; Transite Asbestos Shingles.

#### How Big Is Our Merchant Fleet?

Till country is following with dcp interast the upbuilding of the United States Merchant Marine If it is not it should be for there is no great industrial effort of the day that compares with this either in the present insignified or its future, possibilities. The absence of our mechant flag from the high scan has been a source of amazement to the American traveler for many a dread; past and a cause for deep concern to the shapping men of the country. For the prosession of a great merchant feet is something, mare than a valuable commercial asset it is a source of proper particule prind: as a vasible expression on all the seven seas of the enterprise wealth and power of the country whose flag; till liss

whose flag; tilines
So the awakened interest of America in its merchant
marine is in sit fortunat; and should be stimulated by
werry proper means. Infortunatly the way things are
going it is impossible for the average citizen to under
stand just what progress we are inaking relatively to the
other ship-owning nations. This bewilderment is due
to the fact that the Shipping board talks of its ionnange
one language and the rest of the martinen world in
another and as it so happens the difference is such as
to lead the American public to believe that our flect
is 50 per cent larger than it is in comparison with those
of other nations.

The Shipping Board speaks of its ships in disabugations whereas the whole martime, world always has and does now speak in terms of gross tons. Now a gross it in a shout fifty per cent larger than a deadways to a most final manufacture of the shipping Board nomendature means dendwight tons and a subtract in of one-thrid he inside it comparing our total tonings with that of the rest of the world we shall have a greatly exaggerated at day of his to being accomplished.

Thus if we are told that our total tomage deadweight, is 9 200 000 tons and then find in some shipping journal that the world's total is 17 000 000 tins we shall jump it the false cont insome that we own one-fourth of the wild shipping. We matter of fact we only for the wild shipping. We matter of fact we own but consent the 47 million tone of world shipping being expressed in gross time is equal to ever 55 million tone deadwight.

The as if the term deadweight is due to the fact that the Stape  $\lambda$  B  $\lambda$  I made its centrates in deadweight tons (as if in left  $\lambda$  I) is the set if large shaped and it was in if  $\lambda$  in all it them to make it as monorement of what it was gives  $\lambda$  in only the returns. Loosably the Board all  $\lambda$  I it is pression in melature somewhat for the effect the large  $\lambda$  it does not be now to worst it passes on this in shape come the Board will surely all  $\gamma$  the terms which are in universal most throughout the norminary will be the order.

#### The Advent of Colloidal Fuel

HAT are we going to do when our oil walls with marty? And dry they certainly will run in the near future unless our geologate are activities. We have used up 40 per cent of our native supply of petroleum, a waves iranklin K. Lans, reservatary of the laterior Between 1850 when petroleum was first discovered in Prinasjivania, and 1917 we drive from our undarge und reservoirs a total of 100 000 000. Today there are left in reserve for each of an a more matter of 70 barris. It proposed is disquienting because we are draming Nature's supply with uncreasing volume each added tax live month.

I or our newly-created merch at a marine we shall need about 32 000 000 barries of foul it in the ansuing year and our fighting fleet will consume in that time a round 4 000 000 barries. These are merely straws which show the trend of the current of community in Quiet half of all the petroleum mined in the country is used for steam rassing and these are parts if the United States today wholly dependent upon liquid fuel. Crude oil and petroleum derivatives are independable to our industrial progress and to our many other manifold activation.

In sentistic are no less insustent that anthractic coal as luxury and that Nature has needs it dutressingly pain that that fuel will cease to be available here in the next forty or fifty years. Be this so it may it is included the next forty or fifty years. Be this so it may it is included the next forty of fifty years and the next forty of the next fo

Happly for us, the Submann Difease Association, largely through the investigation of its empineer Mr. Lindon W. Bates, has answered this momentous quistion. Thanks to their combined efforts during the war to produce a smokeless fuel and to safequard our Allies from a shortage of vitally necessary fuel oil they have voived a combination of oil and pulversate coal etc, which is termed collidad fuel. This source of energy can be fed to the burners of any existing oil-burning equipment and does not call for change of installation of any sort. In just that measure in which powdered coal, tar ground cole etc. is added to each gallon of the liquid fuel a like quantity of oil and supensed with and yet the total value in heat units is actually augmented.

To make the practicable many months of laboratory research were required to discover a medium which would neutralise gravitation and keep the introduced heavier particles of carbon from setting and calling for some special apparatus to str up the insture just before drawing it from the tanks for burning. The new agent is a paste-like greasy substance called firsteur. Twenty pounds of this stuff in a ton of liquid fuel keeps the powdered coal and tar suppended in the oil and evenly distributed throughout its volume.

As a result of this seeming annulment of one of Nature a laws it is possible to combine in a stable lough fuel 45 deper cant of oil, 20 per cent of the and 55 per cent of oil, pulverned cost, thereby replusing over one-ball of the hold oil as curing equal or greater host values per barrel and oil as curing equal or greater host values per barrel and fuel can be prepared which, upon a given tank capacity, and ligwe warnhips or merchant vessels a 20 per cent of merchand steaming radius neer that possible with the usual fuel will all the fuel passive am mobile to sustained and easily applied pressure and may be thus pumped fed and it sumed in the cost in ston changed.

the achievement makes it puntitable to commingle the waste products of the mint the gas-house, and the oil rebnery and thus to cut d sin to a large extent the present consumption of fact and a sone result of our fifort to neutralise the gram activities of Teuton U-boats, we now have offered us a potential economic boon of coormous value.

#### Science and Utility

HE ancient Greek took what solence he possessed he as a mental recreation altogether. He pursued he geometry, not with any idea that it was or could be made of practical use, but solely because it in appealed to he in stellect. Indeed, he went further than thus, he actually frowned upon its practical use, and in the rare event that such profanation became a practical measurement that such profanation became a practical monosity, he placed it in the hands of his slaves, so that at least he own much might not be degrated by the shameful contact between the beautiful world of thoughts and the commonplace uply world of things

Today we soom universally inclined to push to the other extreme. Nothing is worth doing on its own grounds without consideration of its practical bearing. Leven physical oxercise, in which we includes with as enthusiasm duplicating if not actually exceeding that of the Greek himself is apologued for as a means to the altogether practice of keeping us in physical condition to do more work and batter work in our weeking hours. As for mental excress or mental recreation

—this to the utter durany of the classicants, as a lost art. Most of use do not attempt it at all. Some of us pre-tend to partake of it but turn such parteipstion into a commercial side-line—a means to make spare time pay cash dividends under the more or less plausible pleas that the change of work affortis an enjoyable relaxation from our regular occupation. And those of us who really do pursue a mental recreation without hope of manual advantage bring to it the same misensity that characterizes our real vocations so that the professional sologust or conchologat or some-other-time-of-same ologists counts himself fortunate indeed if he can keep up with the amatteru who follows the line only as a kobby with the amatteru who follows the line only as a kobby

We do not know whether all this is to be counted as an advantage or as a disadvantage in casting up the account for and against the modern viewpoint as to what is and what is not worth doing Certainly there are advantages, even if this be not among them. In particular, there is the paramount advantage for which we are really striving more or less consciously that what we do really gets done with more effectiveness than it otherwise would The Greek intellectually was our equal-perhaps even our master Yet he never set up a civilisation that amounted to saything in any other direction than the artistic, simply because he never could be induced to bring to bear upon each other the facts of everyday life and the things which he knew or thought he knew is in our ability to work out this correlation that we may find the key to modern progress. And it is clear that to our insistence that all things pay their way we can directly trace the current partnership between the man who knows and the man who does

This insistence can be seen on every hand The mercest school child claims the privilege of deciding, on strictly utilitarian grounds, what shall be taught him, of reporting or at least ignoring every sgrap of schooling whose utility cannot be demonstrated. The decision between French and Germans and Spanish hingse on the tweese French and Germans and Spanish hingse on the tweese French and Germans and Spanish hingse on the tweese of college vs. business as adjudicated on a hard The case of college vs. business as adjudicated on a hard the season of the sea

The answer to this question is always pertinent, and usually interesting Its pertinence and its insteasi increase with the appearul complexity of the subject, and the appearunt improbability of its ever attaiging, a basis of practical use. As a case up point, we may believe attention in this work is SPECHARINTO on Uniter-relate energy and its commercial application. The strikes, of using nutrients belief in his brefines will intrigue the laymnam much in the same manner as did the same notion with regard to X-rays and nursies warner.

Air Service Canuarities in A. E. F.—The War pepartment has recently amounced that during the serial sighting at the front, the American Air Service suffered 854 casualizes as follows Killed in action, 171 pracestes, 125, wounded 129, missing, 73, killed in accidents, 43, muscallaneous 4 The number killed in actions in over a third of the canualizes During the month of September 181 casualizes were reportable.

Government Sales of Flance and bquipment— The War Department authorises the following statement from the Office of the Director of Sales Sales reported to the office from March 8th to March 14th, inclusive, include the following Air Service equipment. Airplance, 3319,000, airplance equipment, 8078,887. These figures are interesting in view of the vast amount of aeral equipment which the Government has for sale in the process of reduring the Air Service to a peace hass All masterials sold by the Director of Sales aggregated 42,499,827 within the time covered by the foregoing

London-Cape-Town Air Flight — During the next few months the Britash art Munistry propose an experimental fight from London to Cape I own bxploration parties are out on the road brong upon stope and petrol estations, which as far as can be arranged will be about 600 miles apart. The route sket tod will probably be London, Paris, Marseilles Naples Croic, Egypt Nile Valley, Northern Rhodens, Vetoria I alla Johannesburg and Gape Town, a distanct of some 7800 miles It is expected that a Handley-Page machine similar to that which carried General Salmond from Egypt to India will be used.

Flares for the Trans-Atlantic Pilers—Ilame and senoire farse developed during the war and improved recently by chimical experts of the army will be employed in the coming trans-Atlantic fight effort of our naval armen. It is understood that our armen will drop three first as it interests, so as to determine the drift of their planes in the cross winds and to make the corrections necessary to keep them on their course. The flares are so constructed that they ignate upon touching the water. By day they may be seen by means of the column of smoks, while at night they can be detected by their bright flare.

Our Air Service for Peace — According to the latest available information, it is understood that the Army reorganisation plans upon which the War Department is now working oal for approximately 1,700 annually 1,700 annually 1,800 and the now working oal for approximately 1,700 annually not satual commission and a minimum available reserve of 3,400 additional plane. This absend upon the preposed minitary establishment of 500 000 men in which total heart service personnic will be i,720 officers and 21 8,53 mag. There are to be 87 service squadrons, of which 42 will be assigned to coast defense work in the 1 nited States and Insular possessions, 20 will be pursuit squadrons and 25 observation and bombing squadrons. The typical Army simplane squadron includes 18 planes in service and their personnel CI for bolowration halloons it is understood that there are to be 42 divided into three wings of 14 companies each

What Are the Military Airmen Going to Do?-Now that the war is over, there are thousands upon thousands of airmen with nothing to do They have been returned to civilian life within the past few months Some of them have already gone into their former occupations, while others are still undecided But how do they feel toward flying as an occupation or a sport? That was the question recently saked of a group of demobilised airmon in one of the leading New York clubs One airman, who has done good work in the war, stated that when he landed from his last flight in France, he swore he would never again leave the ground. He confessed that he had flown purely as a military duty, and not as a sport Another sirman, while feeling the same way at first, began to long for an airplane after being in cavilian life for a few months At last accounts he was going about soliciting employment with American aircraft organisations as an airplane tester or exhibition Still another airman felt that there was nothing mercial aviation in the mmediate future, in the United States, at least, and that as a sport it was far too expensive for his procestbook. As a general thing, the vast majority of former military and naval pilots are eking fields other than aviation for their future efforts.

#### Autronomy

The Latest Astronomical 'Bull' We are again indebted to the I reach Journal I Autonomic for r acting from oblivious a delightful example of newspaper astronomy. A writer refers to the interest which enables an autonomer to at up all insist to watch a trainst of Venus. It is remark appear. On no kee a plue than the Educational Supplement of the I ondoor Tenus.

#### The Star of Highest Known Radial Velocity

From the spectroscopic measur ments made at Mount Wilson Observatory to determin the radial velocity of stars (i.e. the speed with whill this are approaching or reaching from our solar system of approaching or reaching from our solar system in the approaching of sealing from solar AC B within 1886 has a real of velocity of 39 kilomaters per second, the highest constant velocity of a observed for any star. Nint in this come Lalande 1986 with a velocity of 325 kilom ters per second in the opposite direction.

Can the Corona Be Observed Without An Eclipse? -50 many impossible" things I we been done by astronomers that it would be rash! assert that no means will ever be found of observing the solar corons except during a total eclipse. Some b peful experiments in this connection have recently ben made at Mount Wilson Observatory and are still in progress Director Hale states that two methods of detecting the corona m full sunlight were tried by him many years ago. One involved satting the second slit of sp trobe hograph on the center of a dark line of the star spectrum. This would produce a reduction in the brightness of the sky without diminution in the light of the e irona as the latter s assumed to be derived from a c ntime me spectrum. The other method consisted of attempting to measure with a sensitive bolometer the relative religion of the coronal streamers and the sky between them Neither plan was successful. At the total school of lune 1918, Dr. Stebbins obtained with a potassium photo-electric cell large deflections corresponding to the total radiation of the corona (probably including the chromosphere and prominences) Professor Hale was thus inspired with the idea of using the photo-electric method in full sun light, and accordingly experim nts have since been made at Mount Wilson, by Flirman with two photo-electric cells exposed to the sky at moints equidistant (about two minutes of arc) from the sun s limb cells are connected with an electrometer in such a manner as to give deflections corresponding to the difference radiation received by them. If one cell were directed toward a coronal streamer and the other toward the sky between two streamers, the radiation would be unequal, and it was hoped that by this no ins the difference due to the added radiation of the corona might be detected Unfortunately continual small fluctuations were found near the sun, making the measurement of very small differences impossible, but the work will be continued with improved apparatus Professor Hale thinks it barely possible to send up balloons carrying photoapparatus, directed toward the sun by a gyro stat and controlled automatically by the heat of the sun's image, to a height sufficiently great to get rid of the atmosphere glare around the sun and allow the corona to be photographed without an eclipse

#### Automobile

The Mileage Helps Sell Cars. The trouble and the expense still boon large to the owner or proper two owner of a car and neary, man is convinced that the car would be all right if the vexitious result be avoided to or at least number 1. One in minufacture use to financiar the three cars and proper two purchasers that the care expect to ever 1.000 miles on a set of times. Before long the the ompany work exhaustively, into the records of their cars and found that its some cases individual in this is hit mids as much as 21,000 miles on a set of time. The poly records made are asserbed to the smooth rationing of the eight while results are asserbed to the smooth rationing of the eight valued consideration and are asserbed to the smooth rationing of the eight of which is some and the second field distribute its works.

Circumventing Car Thieves After considerable onsideration and discussion the National Autonobile Chamber of Commerce has come to the conclusion that there is no such thing as a lock that will absolutely prevent the stealing of an automobile the best that can be looked for it was believed as so much trouble for the would-be thirf that he will be discouraged because of the chances of dete tion while trying to circumvent the lock. The consensus of opinion was that the best kind of a lock is one that locks the genriet and the next the lock that prevents the use of the steering gear. The suggestion was made that a bill of sale containing a complete detailed description should be given to the purchaser of a car to be transferred in case of the transfer of the car to a new owner this document furnishing means for identifying the machine in case of theft

#### Highway Transportation Being Readjusted

The sudden decline in the demand for the transportation of mershandise has proved a hard blost to many concerns which during the war did a huge business over the roads. Large fleets, in some cases have been practically put out of commission. Some of the truckmen are reorganium, their business and altering their plane to suit new conditions which are normal conditions. Smaller concerns are roung out altogether. This is some means an unhability sign. It indicates samply that abnormal conditions have ceased to exist. In the abnormal conditions have ceased to exist. In the cases is suddenly that practically all were unprepared With some warning adjustment could have been made but the warning was lacking. The radjust ment period is an uncomfortable one for many but it is be theved that the true kine through it in good shape

Cooling System Precautions -With the approach of warm spring weather motorists who have been using mixtures of denatured alcohol and water in their automobile cooling systems during the past winter as an anti-freezing volution should be careful to reduce the proportions of alcohol to a low point and run strong percentages of water If the proportion of alcohol is too great the low boiling paint of the cooling maxture will result in averheating of the engine. As there is still a chance for a cold snap or two during April, the alcohol should not be completely removed but a 15 per cent mixture will give ample protection. If anti-freezing solutions including calcium chloride or other soluble salts have been used the motorist should flush out the cooling system thoroughly with water under city pressure to wash out any crystals or incrustation in the watertackets or radiator tubes due to evaporation of the water and consequent merease in salt proportions before the coming of real warm weather

New Steel Wheel -A Philadelphia manufacturer is producing a steel wheel for automobiles that looks very much the same as a wooden wheel It is built up con struction but is simpler than the usual forms because there are but few welds and these are easy to make believed that a wheel of this nature can be made as light as a wooden wheel of the same size and be very much stronger and not subject to deterioration or damage as the wheel of less resisting material would be Lech of the shanks or wedge onds of the spokes are steel eastings but these could be drop forgings and it is possible to make them either individually or to cast or forge the whole set in one integral portion. The tubular steel spokes are welded in place and the number at the upper end which secures the felloe is afterwards pecued over so as to hold the rim absolutely The felloe is of a rectangular box section and the tire carrying rim is, of course fitted outside this As the wheel looks exactly like a wooden one the motorist of conservative tastes cannot object to it because it is unconventional in annearance

# Floating Mines in the North Atlantic and Arctic Oceans

Trend of Ocean Currents in Relation to Dangers to Navigation from Mines Which Have Broken Luose from Their Bearings

By His Highness, Albert, Prince of Monaco

This ways I in North Athanta in seconds affected as rigid is the height in its offer in superlanding to the long matter of the state of the long matter of the long them to follow the course of the Gulf Stream toward the south the others to join those which after starting from the course of Iroland or from the Just Sca have traversed

the Arctic Orean and finally is a health; cost of Norway, I have momes which stated from the French Spanish Portugues and Moroccan costs of the Atlantic, as well is these whose point of departure was in the Canary I shands. Medera, the Artilles, the Bernardan or the

A res have entered the great system of necame in ultrium. However there is set up by the interest of the Gulf Stream and my previous studies a norming it have proved to be exact in their data, not only as regards the direction pursued but dwa

Mexico Shortly afterward they again pass into the current of the Gulf Stream at its exit from the Gulf of Mcxioo, exhibiting a tendency to remain upon the eastern edge, which enables them to visit the Bermudan Archipelago and arrive at that of the Asores

Arthpreago min arrive as use or the careers in the cut of the care of the oceans whirlpool formed by the Gulf Stream, whose saw revolves somewhere in the regular southwest of the Anores, by far the greater part of these mints which have come from the Antilles must crucial; indefinitely, according to the law which regulates the cutres of the florasm in that part of the ocean, known by the nums of Angasso Sea.

After having floated thus for a greater or less distance along the northern, the wanthorn, the eastern, and the westrn shores of the Archpelago of the Asores, but without ever traveling for beyond the 50th degree of lattitude toward the noth and the 15th degree of lattitude toward the south and twisted the degree of lattitude toward the south and without eatering the cold current to the word which hathest he castern

shores of the United States these floats coming from the west airive in the offing of the Lengist Channel, noar their point of departure, after having travised the greater portion of the space with a suparates the Azors from the Pitropean continual. They then start out afresh on their travelsial on the words after the start out afresh on their travelsial one two routes. He must have a farmed to the start out afresh on their travelsial matching the start out afresh on their travelsial matchinetic trav

countered

There is a crimin analogy between the selfout sea at the floating miner implicated during the Crist Wan which smalled use to make use of similar methods in calculating the curse of travel of the latter at the possible however, the selfout selfout the terminal of the latter at the possible however, the latter is the possible however, the latter is the possible floating that the latter is the latter in the lat

scherble degree of danger which continues so long as they can railout. And it require extendible a number of the above compact from the hids where they were more I. In war between Japan well bases furnished example of extrapoper arrange for in I. feet their the tray I of they wandering bodies was not arrested by the cell of historia.

Since it would search be possible to receive the oriental beautiful statements of the force of the control of t

Ocean currents of the North Atlantic showing the probable path of drifting mines

with respect to the spect of travel According tomyrescatches the mines a first from their mourning along the cost of lurge and that of Africa, from the Inglish Chamict to the morther actremity of the Canary Islands have entered by degrees into the Capacity

cur at after having (taveled toward the south and coasting along without
touching the northern shores of the Cape Verde Islands,
withbiting at the same time, at rend toward the west
Thersafter borne toward America by the said equational current they visited the Small and Great Antilles
as his time the Bahama Islands coasting especially along
the castin region of these archipelagues are
the same times travel by a rule it was far even as the coast.

A mine anchor of the type that automatically regulated the depth of the mine

left the coast of Great Britain somewhere near the Hebrides and visited lecland doubtless also have disappeared among the floating ree along that coast I do not know whether it is a fact that a few mines coming from the west have managed to penetrate into the North Sea by the English Channel, but this is possible

tion not know whether it is a lact that a rev mines coming from the west have managed to penetrate into the North Sea by the English Channel, but this is possible fluth mines as may have been planted along the creat of the United States much have entered into the great cycle of flotsam after having been caught by the

narrow polar current which descends from the north and follows this coast nearly down to the entrance to the Gulf of

I have calculated the speed at which such bodies as these mines move from place to place, employing data obtained in my vious experiments with flotsain previous experiments with flotsain inconclusions thus arrived at are as follows. The mines which leave the English Channel with the oceanic whirlpool as their destina wind and constitute windpoor as their destina-tion travel toward the south, reach the Spanish coast near the lower part of the Bay of Biscay in the course of about two months After leaving these parkways they double Cape Finisterre and continue to be driven towards the south along the coasts of Portugal and of Morocco reach ing the Canary Archipelago 10 months r their departure from the Channel

Three years after making their original without counting a amount of time lost while passing through the Canaries, the mines have su coulded in crossing the Atlantic within a zone where or are found the equatorial current the curwhich gives birth to the trade winds A considerable number of them succeeded A considerable number of their succeeded thereafter in reaching the Antilles espe-cially the Archipelago of the Bahumas traveling at a speed of 10 inites per

And those muce which do not then become detached from the great swerm which have arrived at the entry of the English Channel and second towards the fjords of Norway after having encled Iroland upon the east and upon the west resign upon the east and upon the west commence ance their voyage around the Atlantic along the same path as the first The average speed calculated as required for the accomplishment of the evel by the mines is five miles per 24 hours

the muos is her mits per 24 hours.

The floating mines placed in the Mediterranean are not susceptible of having their course predicted except in a very small area situated between Cobroltan and the upper portion of the Baleani isles whither the general currents carry the waters of the Atlantic while the counter currents carry them towards the west along the coasts of Spain and of Africa

As for the mines which have broken loose along the eastern coast of the United States they have been captured by the cold current which loses itself in the captified by the cold current which loses likely in the Gulf Stream near its point of origin at its exit from the Gulf of Mexico, and have thereafter entered into the general circulation here described While the data given above show the principal lines

which are most dangerous to navigators because of floating mines, I cannot guarantee navigation against individual mines which may have been carried outside these general lines by storius

It is possible that the mines in question may float in the Atlantic for a very long time, since my experi

mental floats have done so for a quarter of a century, the best means, therefore of avoiding cata strophe from them us to direct the eourse of naviga-tion so that it will he as far as possible outside—the—cycle traversed by these dangerous engines of war This cycle causes them to pass and repass among the archipelagoes scattered through-out the Atlantic Ocean; it as even possible that large numbers of them ollegt around these slands attracted by a special force and may be retained, longer or . shorter time, by the influence of the tides and of local currents until carried again

This map shows why the German high seas fleet spent so much time studying the skyline of the dockyard buildings at Wilhelmshaven

the general circulation by the n thin of certain winds In the both of course, the will be open through the explosions produced by their chance encounters with some other piece of flotsamer with the rocks along

The regions most subject to visitation by these mines may be caumerated as follows the inner and southern portions of the Bay of Biscay letween Bordeaux and portions of the Bay of Bueen | ctw-in Bordaux and cape I mister; the western | stof Portugal that of Morosco and the archipelago | the Canaries as used Madera: the arca included betw-in the Inglish-Channel and the Canaries as particularly languous because, the winds which dominate this per in a of the Atlantic varies as crisin influence upon the true-partition of the super-ficial stratum of the waters and issest in driving the flotsam of the high seas toward these coasts. Between the Canaries and the Antilles the area visited becomes wider in the sea surrounding the Antilles the mines are both more widely scattered an limite upt to be destroyed because of being driven against rolly reefs. The return

towards I urope of those mines which liave failed to be destroyed is along a narrower path until the Archipelago of the Azores is reached at this point there is fresh danger of collision because of the accumulation of flots on similar to that in the Sargasso Sa whe has produced here by reason of the fact that this is the intral are of the wholphole council by the combined influence of the clif Stream and the cquaterial areast. The arcumulation of floating more who be accompensally numer. ous at the cuter is doing the periphery of the cycle they is low has been aug a unted by the continual escape of these engines of destruction during the last four 3 CRITH

The ships which travel lack and forth between lurope and the listed will find their greatest safety north of the line which runs between the entrance to the Inglish Chunclan I 50 degrees of latitude north and by foll wing this as far as 30 degrees of lyngitude west afterward turn ing downwar is toward the southern coast of the Boils of Newfoundland. The waters of the wrim current flowing from Am reat war I I prope probably mark the northern limit of the dangers which may be encounter 1

It may be stated in general that the slups whi h triv II tween the southern portion of Europe and the United States will en or rarge and the United States will en-counter their greats trasks in the virinity of the casets of Lirapic and of the Archi-pelagnes as fur down as the southern perturn of the Canary Islands and will find their safest course of travel along the line possing a little bit to the north of Madeus and following a traverse larger the nd following a tangent along the southern edge of the Surgasso Sca

From the same point of view the central region of the North Atlantic between 32d

degree and 13d degree of north latitude and between 3th and 50th degrees of west longitude (Greenwich) will be the most dangerous area. The danger of encountering a still active mine may continue for a long period of time siree the simple floats utilized (Continu ton pag 410

#### Locating Unexploded Shells on the Battlefields of France

By F Honoré
Paris (orrespondent of the Scientific American"

THI location in ground that has been fought over and subject to bembardment of projectiles that have failed to explode constitutes a very deheate problem, and one which must be disposed of before post agriculture can resume business at the old stand to be sure are relatively of little danger. Their failure to go off in the first instance is in general, due to broken fuse or an inert charge und chine that precautions are sufficient for their removal without fear of explosion Moreover most dud shells penetrate to a depth

that can hardly rached by a plou share Grenades on always active are never far from the surface and the least shock de tonates them

Impelled by the numerous accidents that have befallen cultivators entrust ed with the work of agricultural restora tion in the vastated regions M Unition, Professor of Physics at Nancy, has got up an in gemous apparatus to determine the position of hidden projectiles It is based upon the prin cuple of the Hughes induction balance invented to study the molecular struc ture of metals and allove and also used by the surgeons in (Continued on page § 16)

#### Sir William Crookes

#### An Appreciation of a Great Physicist and Chemist

By John W. N Sullivan

Will the death of Sir William Crookes which took place in April 4th the world of serince mouries the loss of an investigator who belonged to a type which is very sold on met with memodern times days specialization is a fitness that it is hard to had a physicial who has done work in in rethin on or two tranches of physics or a chemist wh has d ne work in William Crookes we had a man who was a dim t descend on the grants tell men who a uld turn their ı uld turn their attention with equal cost to several 1 the great divisions f seigne and achieve will flisting at portance in a h. Sir Within wis lin in 183, and his life is one the state of the s

ursi great account. By VP i me abovey or the new mich lithallium. If we's led it this discovery in a u of analyses [10] unds of the set offerous dep set from the subblurie and min thereby at 1 like ide in the Harts. Mountains the substance being placed at his disposal () it i Hofmann in the year 1850 Spectres and Camination re-vealed a bright given line which he had never met with 1 of me and which he found to be characteristic of a new metal. During the next 12 years researches on the out culminating in his determinatim of the atomic weight. The amount of labor involved was immense and the care with which the investigation was carried out was such that even now Crookes value for the atomic weight of thallium is regarded as the best. With the ow accepted values for the atomic weights of oxygen and nitrogen the atomic weight of thallrum as determined by Crookes 18

In making this determination (rookes

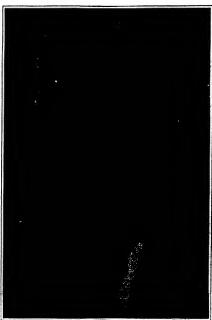

was troubled by irregularities in the weighings and as so often happens in scientific work was led to a new discovery by investigating these apparent errors weighings were made in a partial vacuum, but the action of the balance in these conditions appeared most capricious weight of the substance appeared to vary with the temperature but it fills iys in the same direction. As a result of his persustent efforts to trace the cause of these disconcerting phenomena he was led to invent th w'liwn instrument the radio-meter. The dynamical theory of gases at once furnished an explanation of the curious effects observed in terms of the action of the residual gas left over in the vacuum and in spite of the immense amount of work on the stresses in rarefied gases resulting from inequalities in temper-ature to which Crookes discovery gave

birth the subject is not yet exhausted
Crookes was thus led to consider the phenomena which take place in high vacua and in his sulsequent researches we have the very flower of his work. It is well known that if we pass an electric discharge through a high vacuum rays are shot out from the negative electrode the kathode culled kathode rays. They had been nevestigated before Sir William published he experiments in 1879 by Glucker in 1879 v Hittorf in 1869 and by Goldstein

in 1876 but Crookes in a series of brilliant experiments greatly extended our kn wledge of their properties and propounded the theory as to their constitution which in a refined firm is the one that is accepted at the present day

He showed that the kathede rays proceed in a straight but from the negative electrode when ver the positive electrode may be that they east a shadow when intercopted by solid matter and that they exert a strong mechanical action where they strike. He showed that mechanical section where this strike. He showed that they are influenced by an ingente tield the direction of motion being changed and that heat as produced when they motion is arrested. He also conducted some beau-tful appariments on the power of the katholic ratio to excite phosphorescence in preparations of calcium salfide shining with blue-woilet volley, orange or grean high, in disamonds shining with nearly all the colors of the rambow and in rubies glowing with a rich full red. Crookes considered the kathode rays to be matter in a fourth state, neither solid liquid nor gaseous. He regarded them as constituted of particles negatively charged and projected with great velocity from the negative electrode

In essentials this is the modern view of the rays xeent that while Sir William regarded the negatively charged particles to have molecular duncasions, they are uning a particles to have molecular rimin minons, they are now known to be very much smill; that the smallest known atom With real prophets might (rockes saw the part that these high vacua ph nomena would play in the advance of science, and in view of the fact that these phenomena underlie the while of modern physics and have entirely changed our conseptions of the material universe it is of the greatest interest to read the following

Str William Crookes

words of Crookes when he slow among his contempore aries forceaw the present devel pment in physics.
In studying this fourth state of matter, we s

in studying this fourth sinte of matter, we seem at length to have within our grasp and obscient to our control the little indivisible particles which, with good warrant, are supposed to constitute the physical basis of the universe. We have seen that in some of its properties radiant matter is so material as this table, while in other properties it almost assumes the character of radiant operary We have actually touched the border white in other properties it aimset assumes the character of radiant energy. We have study touched the border of radiant energy. We have study touched the border another, the shadowy resim between known and the known, which for me has always had peculiar temptatums. I venture to think that the greatest scientification. I venture to think that the greatest scientification is recommended to the study of the

let all these were, when no man did them know. Yet have from wisest ages hidden been.

And later times things more unknowne shall show.

Why then should witlesse man so much misweens That nithing is but that which he hath seen?" It wiplessant to think shat Mr William tived 1886

enough to see his predictions verified and to get a full view of that mysterious and attractive region which lies just over the border ( rookes next, in 1881, published a research in which he

returns to considerations connected with the dynamical theory of gases. Maxwell had made the great theoretical discovery that the viscosity of a gas is independent of the density, and it had already been the starting point for experimental observations by Maxwell himself, Kundt

u nac arready been use startung point for observations by Maxwell himsel, Kundt and Warburg, using the method or rotating datas. Crocket took up the subject and devased a very simple y- eP-wast own of appearatus. He merel's vaspended a lamina within a bulb containing the gas and noticed the subscience of its oscillations when it was vibratung. Hef. and, what Maxwell had himself foreseen, that Maxwell's law completely breaks down for very high exhaust ons
In the same year Crooker published a

paper n an entirely new method of spec-trum analysis, based on the fact that under trum analyzas, based on the fact that under the nuture of kathes rays a large number of substances omt phosphoreaeat light if he phreshoreaean light from the phreshoreaean light from but in some cases the spectrum is discontinuous and rookes made a special study of such bodies. Those experiments comprise his well known researches on the rare earths, especially yitras in some of its compounds and in this connection he obtained very valuable results, to which he made intermittent additions as time went of a new earth, characterized by as isolated strong group of lines high up in the ultraviselt ascribed by Sir William to a new element named by him victorium. In more recent times he did some valuable experimental work on radium. The substance known as uranium X was first superated from usrainum X consess. the influence of kathode rays a large nur

eparated from uranium by Crookes in 1990, by two distinct chemical methods. His well known and popular instrument, the spintharscope, was the outcome of his discovery in 1993 that the alpha rays from radium produce, by their hombardment, phosphorescence on a target of crystalline sinc aulnhide.

He married in 1856, when only 24 years of age. He was a member of numer, as accentific sometics both in England and abroad, and among numerous other honors received the Copley Medal in 1904 He was knighted by Queen Victors in 1897 and sohieved the greatest honor open to an English man of science by being elected president of the Royal Scienty in 1913

president of the Royal Society in 1913
His striking combination of diverse
gifts, keen observation, patient and inexhaustible experimental skill, together
with the glowing mind and imagination
of a post, have assured him for all time a
settled place in the great list of English

#### Italian Lavas as a Source of Potash

Italian Lavas as a Sentree of Potask

DR Hearty S. Washington, of the Carassic Gomphysical
total amount of potash present in the lavas of the air
total amount of potash present in the lavas of the air
chief volcanoes along the west coast of Italy that have
reputed lesurite lavas A conservative estimate is
10,00,000,000 tons of potash (K<sub>2</sub>O) Dr. Washington
believes that in these volcances Italy possesses one of
the largest waiths supplies of potash known to exist, if
not the largest important allients-rock nourses of
potash are also available in the United States, including
the Lesurite Rills in Wyonsing and the belt of planonable
that extends from New Jersey into Virginia. The latter
is estimated by Dr Washington is contain 3,084,000,000
metric tons of potash.

## The French Problem of Reconstruction—I

In the Path of the Shell

By C. H. Claudy, Special Correspondent of the SCIENTIFIC AMERICAN in Paris

It is not possible to visualise the English reconstruction problems from a platform constructed solely of American ideas. It is less possible to see all of the French problem from any usewpont 3,000 miks away no matter how added with photographs with descriptions, which is the latter section. with talks lectures, exhibits

with talks lectures, exhibits
It is an impossibility for the himman mind to grasp the
extent of the physical destruction in France even with
the direct and of the senses and if the traveler in and
around the devastated regions finds it impossible to realise the extent of what he sees and hears how much more difficult must it be far loss who must depend upon written word, the printed picture to grasp the amount of damage done?

So one starts the statement of the problem with the full knowledge that after all figures are only insensate things, and phrases like 'the town is totally destroyed to lack power to convey idea merely from their constant repetition and their utter madequary to repre the matter of the destruction or the desolation which hangs a pall of absolute lifelessness over the ares where the Hun the shell the wanton destruction and that not wanton but inevitable in war have laid their searing touch

England the reconstruction problem is entirely economic, political social The physical aspects of her post-war pussle are merely the mechanical ones of conversion of war plant to peace basis, of construction of de layed buildings, of putting in condition run down rail ds, of rebuilding shatters d industries of resettling al-tered labor conditions

In the United States when we talk much and do little (governmentally) about n construction the problem is big only because we have no true perspective upon it to English eyes it would ap pear small and to French eyes it does not exist! For the French problem of reconstruction is first and foremost a physical one— a matter of building homes again where are now piles of ruins-a matter of getting under cultivation land which a matter of making fields of grass and grain out of fields of barb wire and poles a matter of making roads, mending bridges, getting ina-chinery, creeting buildings in which to put the machinery, persuading absent and scattered population to back to the new town and into the new building to

run the new machinery Before I rance is ready to think much about economic reconstruction she wants homes for her homeless and tools for the toolless smiling towns where now gape raw wounds in the land scape—she wants fields which are of use to man where are now charnel houses, bone yards, pitted areas of clay and mold, useless alike for farm for home for pasture or even for weeds

So it seems reasonable to attempt to give some idea be it never so feeble, of the extent of the physical problem before trying to show what France is doing to remedy the results of war on her soil. One knows well that neither words nor pictures are adequate, but they are the only means by which those not able to come and see for themsives can get even a hint of what has here been done

swives can get even a hunt of what has here been done Figures are not impressive in themselves. To say for instance, that the total area of destruction in France is about two per cent of the total area of France is apit to make a reader exclaim mentally, "Oh, well, that's not so bod, after all—I thought about half of France was damaged! The total area in the devastated region is about 6,000 gauss miles of territory, supporting about two million propile Do not confuse this with the total invaded area of France, at the time the Hun was

farthest in he had control. It were two per cent of France At one time the invader of upred 15 000 miles including 3 500 communes containing over four million people. But even the Hun caunot lests a when he retreate in a hurry and much of what he night have destroyed he nurry and muen or what is ingut nave destroyed it postsponed because he wait it to inimas! Where armies awarg back and to the juckly in advance and rivest the destruction is superical agrain trampled cattle stolen fences raze! I votice buildings of which France has very few burn! But where armies face each other locked in position for some time destruction. ulnte and often it is is at the work of the shells of the defender as of the will inness of the invader

of the defender as of the will inness of the invader. Fine destruction of will fixerial virieties. Internally interesting the first probably the lardest to raisely sincert includes it to the raying of landings and the sambiliation of feret but also the churraing up of land so that it may be very before a top sell again forms upon it, capable of rais ignity sort of a crop. The intentional destruction where towns are burned bridges mmed and fruit trees girdled is bad enough but all the intentional destruction in France put together would probably not total a half of the mevitable result of the

. Yankee infantry streaming through the captured town of Varennes in the Argonne

landing of millions and millions of pounds of high ex-plosives in field and effect, in green orehard and wood I rance is faring half a by it different proble insist once and baseoursee smough for a few more af the world wants here to face moved. In fear it undergone one of them her army as another 1 warms, if orchipt in an eleminary is another, feeding, it will set a souths—and still the state of the set of the state of the state of the state of the set of the state of the Parace of the state of the state of the state of the state of the Parace of the state of the Parace of the state of the stat

France estimates (and no very accurate census of rance estimates (and no very actual ectasus or buildings as possible in so short a time) since the armstice that the total physical daming to buildings will reach the round figure of half a mill on structures and that of these, at least half (250 000) have been completely

one trover of the were possible to make the words carry
the meaning. One rides for sole after mile through the
devastated region and sees that things—these sites
where once were towns—these risbush heaps of stones
which once were buildings—these little mounds of stone
and dust and mortar with here and there a gateway. half a wall, a solitary pillar or the fragment of an a stratching mournfully upwards—and never a sign of life No man, woman nor shild, nor now, horse nor goat, no

bird no insect no rit ner eat nothing but I listed stone often so churned into the landscape that the streets of a once prosper use town in upletely of intersted, and
if it were not for map and go de me would not know that here stood a prosperous village

How can figures or work or printers make that They cannot and one can but feel regret at the malnity of the only means at hap I to paint the picture and the impossibility of evers readers making a magic carpet journey through the devastated regions to see fee himself what I rance is facing and learn at first hand what she has suffered af only that our own little reconstruction in iblems took their proper place in our minds and our own work

dwarfed themselves to their proper proportions!

However since figures are all that one has with which to paint let us write figures! A quarter of a millen buildings destroyed and mother quarter million damage I can make rather large figures possible. Trench government engineers say the average cost of the destroyed buildings prior to the wor was \$7,000 that their present cost of replacement is two and a half times that much and that the total cost of rel miding the houses damaged and

destroyed will be in excess of \$6 000 000 000 a regular Liberty Loan figure! Archi teets and contractors assu moderate in their estimate perhaps the government hal an eye to possible scaling down of damages if Germany is compelled to divide up her meomi pro rata among all the albes in indemnity pay ments for years to come and such associations call the total damage \$4 000 000 000 to buildings alone

I rame is a country of stone tile mortar brick the wooden house is almost unki own Arguing from this, many who have not seen a runed town have said 'but the material is there it is mercly displaced. It won t

the stone is right at hand!

But the shell does not merely displace stone it splinters it There are towns which are not runs but rubble piles where not only is there not one stone on another, but literally not one stone left whole where re-building must start with hauling away all the rubbad of what was once a town or the silection of a new town

sight This latter indeed seems so simple a procedure to au American as to make it

appear a necessity. There would be no question in American numbs that given a totally runned town now but a mass of rubble and stone it would be in finitely better to build a new town alongede the old. hading what material was available from ruin to building operation and making the new town with better streets straighter avenues better parks etc , than to clear away and rebuild on the old location

town to us means manapality the war zone is largely a little collection of houses more farmers residences huddled together for companion more tarmers residence and and diagener for companion ship and gregariousness. A wine shop a bakery a small store 10 houses—soile a town! The owners of the stroyed buildings do not want better streets straighter avenues parks they think of the little town as a collection of homes not an entity in itself. And the question of land makes the rebuilding of any other site one of tremendous difficulty

A father wills his land to his sons his sons to their

sons and so on forever Little farming land is bought and sold in rural France Land is all but worshipped there It is France they own and till, these peasants you have them sell their country? A man marries a gir

# The English Channel Tunnel

Story of the Agitation for a Channel Tunnel from 1802 to 1919

WITH the exception of the Suer and Panama Canals, there is no constructive work in the field of civil engineering which has had so worldwide an interest as the proposal to link the British lales with the Continent by some form of roadway Although in later years the proposal has always contemplated the construction of a tunnel, the student of the history of this project finds tunnes, the student of the matery of this project mate that other methods, such as the building of long, low-level jetties, of high-level bridges, and of tubes laid on the bottom, were suggested and were made the subject of more or less serious investigation

#### Early French Proposals

The first definite plan was made by a French engineer, M statisen, who proposed to Napoleon I, in 1862 the construction of a tunnel which would afford a poet road between the two countries. To Napoleon, himself a great engineer of daring enterprise the plan runst have smed more feasible than to many of his contemporaries

In 1833 Thomé de Camond is said to have made very extensive experimental borings in France and England to determine the character of the geological formation His labors were indefatigable. Three times he went down in a diving bell to bring up specimens from the bed of the Channel, and altogether, between the years 1833 and 1836, he brought forward no less than six sepa-The first of these in 1834 contemplated a tube of iron plate laid on the bed of the Channel from Calais to Dover, the length of which would have been

2514 miles
Then, in 1836 he proposed the construction of a bridge 22½ miles in length, which he estimated could be built for \$160,000,000

His third proposal was to build two jettles, each ex-tending five rules out from the slore, with their outer ends connected by a pontoon bridge. This construction ends connected by a pontoon bridge would have been 21 miles in length

His fourth proposal contemplated a jetty reaching from shore to shore, with three navigable channels spanned

by swing bridges
In 1866 he abandoned his previous plans in favor of the more practicable scheme of driving a tunnel from Cape Gris-Nez to a point halfway between Dover and Folkestone. The tunnel was to be so located that it would pass under the east end of what is known as the

Varue Shoal, where he proposed to suck a construction shaft

Ten years later he modified his location so as to make a landing at Folkestone, and he proposed to use the shaft on Varne Shoal to bring up the excavated material and on varie enous to oting up the evaluated material and empty the spoil at the shall, the elys forming an island of considerable extent. In 1859 this plan was so well thought of that a Penenh-British Community was formed to look into it. The tunnel was to be cut by means of a Rotary Brunton Boring Ma thus, the submitted time was four to hve years, and the cost \$40 000 000 100 De Gamond died in 1875

In 1851 Hector Horeau drew at the plans for an ellio treal iron tube which is illustrate I on the preceding page

#### British Activities

Meanwhile the British I I born investigating the problem on their own side of the Channel and in 1866. Chalmers proposed the construction of two circular Chaimers proposed the constitution of two circular iron tubes, which were to be find on the list of the Channel. These were to be his lightly that the channel with timber. Channel channel that the tides would sit up the tubes and thereby ultimately form an imbankment 40 feet high by 150 feet wide. The

we should state, just here that for the shove date on We shourd save, investigation and fir the following account of the British and of the entriprise we are indicted to a form of the British and of the entriprise was an indicted to a November and Descenber, 1940, to which the reader is referred for fuller particular. Chalmers was followed by the first Marden who designed a tube with a doubt slin, the number space that the with a doubt slin, the number space when the shares to be followed in with control. The

between the skins to be filled in with concrete estimated cost of this tube was about \$5.2 HM (AM)

In the early part of the latter half of the 19th century considerable attention was given by engineers to the considerable, attention was given by engineers to the possibility of pneumatic operation of trains and we find that subsequently to Marden's proposal Butten in and Révy got out a design for a set tion tube which was to be carefully machined on its interior face—ind closely fitting (ars were to be propelle I through it by paramatic

Zerah Colburn, that prohib and original engineer proposed the construction of it tube in sections in a

long drydock. When a section had been completed it was to be forced out the nighthe lock gates some form of stuffing-box being contemplated which would allow this to be done

Then came Page who in 1870 proposed to moor at inters ds seroes the Channel eight irea shafts and to lay They were to be covered with concret

Next came Peter W Barlow who proposed an iron tube which was to be surrounded with 21crt. Cambros of brick laid in suphalt. Ottosid of the bark wage was to be a covering of six indies of from the Barlow wag optimistic set to cost. Believing that the thing could be done for

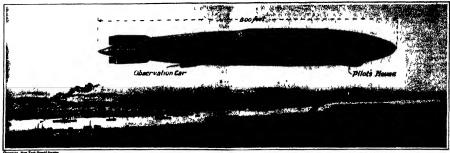

Then came Paul I. Bishop with two (lliptical easi-ton tables which he believed that he could put across for \$110,000,000. The tubes were to be lined with 12 \$110,000 000 niches of parck find in concut with a facing of semen Irution was to be either by steam locomotives or time ilmatic

#### An Exhaustive Investigation

This brings us to the great Sir John Hawkshaw m company with Sir lames Brimlers and Mi. William Low began to study the problem in 1864 and devoted an numerose amount of time and energy to the work 1 xtensive borings were made on either shore and a Extensive norms were mine on either short and a kind a through geological examination was made of the bottom to determine the Lix of the strata. As the outcome, a complete Chainel tunnel scheme was developed by at John Hawkshaw as engineer of a company formed in 1872 Sr John realized that the propert was first and list a geological one. Special apparatus was designed for sounding and securing specimens of the bottom. The question was to determine whether the thickness of the lower beds of chalk as ne sured on the white chils on the Buttsh and Irench sides where all the beds are exposed was maintained after the lower beds dip beneath passed was maintained after the lower norm up nemeating the sea. The borings showed no great duminishing of thickness as the brids were followed seaward from the outerop. A concession was attained in 1875 from the Jrinch and an English hill was presented in 1875. It should be mentioned that though the attitude of the British government was always conservative, the I reach (Continued on page 416)

How the proposed rigid dirigible for the London-New York service will appear when flying over a conventional landscape

# Aerial Greyhounds of To-Morrow

Some Possibilities of Airship Transport Service in the Immediate Future

N I W YORK to I ond in it we days! Traveling you the air with the smoothiness and speed of an express train while enjoying the space users and accommodations of an order liner! Making the translature crossing with a fe ling of so trity which has never before been equil !!

These are not sacrifs for the projects writings of Jules Vern. or the image are cessay of II. G. Wells Far from being the print is 3 void imagenation thay are the cold or lusions of a dading British organization which has set to work on the prib in of commer rid working. And this organization by the way as a wast and undimental one indeed during the way and for many years before its mane has he in a sunonymous for battleships and hand grean its surpleme and drightless maching units and hugs more its. Busing their calculations on well known per fairs necessarily and comprete worked out an impossionate right can be described by which do it an impossionate right can be described by the worked out an impossionate right can dempete a worked out an impossionate right can be described by the property of the control of the comprehensive for the control of t

build a rigid airship to earry 50 ton's I passengers and fright for an on-stop voryag, of 10 000 miles at a speed of 80 miles per hour. It therefore may be definitely accepted that for voyages on which it is necessary to make a non-stop flight between points more than 2 000 miles apart. The durighble is the only mained of serial transport possible and it may also be softly stated that the airship will always be the mist on united means of transport for non-stop voyages of more than 1 000 miles. So it follows that the dirigible must hold the held for long distance, voyages such as the true occanic routes. One of the over a concept, is a Distance of the number of the

long distance voyagos such as the trus oceanic router (moder however a concrete us. The ungineers have chosen the direct non-strop passes uger voyago from Indone to Nive York—a minutum distance of 1,000 miles—for their comparison he tween of rights and the plane services. The analysis is made of the cost of operating a service of two crossings; in each direction of passes, which was the service of two crossings; in each direction of raving our arrange span, it of 30 tons of passes, and the service of the control of the cost of operating a service of the s

catablished in all likelihood at about six cents per ounce. The time taken for the journey would be two and a half days from London to New York by the southern rout and two days from New York to London by the direct route all these fasts of course being based on rigid dirigibles such as have been purposed.

Turning to the strikane, we learn that it is impossible to run as slightless service direct from London to New York but with the largest and most efficient machines at present considered practituable it would be possible to run a I ondon to New York service with intermediate tops in Ireland and Newfoundland for right unkiment of fuel etc. The capital required in this cases would be \$28,800,000 and the cost of operation would be Pasenger rate from fundom to New York, £115, which figures out at the rate of some IG entar per passenger mile, while mail and other light in rehandles would be charged for at the rate of 50 rent per ounce.

while mail and other rigid incrementage wound or consequently for at the rate of 15 cents per ounce.

The time taken, allowing for stops in Iraland and Newfoundland would be two days. It seems obvious that for a regular and established service the cost trans-Atlantic dirigible service is less than half that of the arphane and the time taken is practically the same Ir must however, be pointed out that if the arriship stopped at the intermediate points as necessary for the stopped as the intermediate points as necessary for the maintained of the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as the intermediate points as necessary for the stopped as necessary for the stopp

airplane a considerably greater amount of passenger load could be carried, and the relative cost of airship operation would be considerably further decreased

#### Applicators of Distance

With the development of anxiety arrange of the temperature of the world, it is conceivable that on important city will be farther from Loudon than 10 days journey and the engineers have given some representative arrange results of the second that the series of the second that the series of the second that the series of the second that the second th

The advantages of arrhiptransport will be most apparent for long ocean journeys, and it is proposed that the best route for the first service would be between London and New York, as the is the route on which there is the greatest demand for a saving in the duration of voyage, and a large amount of passeager traffic would be immediately available once the advantages of the service were demonstrated. After the establishment of the

How the nose of the trans-Atlantic dirigible may be moored to the revolving beed of the mooring tower, serving se an archorage and gangway combined

trol of th

An arriany of the arx proposed by the organisation in mel, of a capacity of 1500 000 seudar feet which could be built immediately and be housed in oasting sheds can carry 15 tons of passengers, mails and so on for an air datance of 4800 miles at a speed of 90 miles per hour And it would be quite a practicable proposition to

trans-litiantic service, other services on which another present would offset great commonles in sinns would be a service of the service of t

Further than the saving in time in the actual journey, there as the saving by using an airship service in the elimination of the time taken for trans-shipping and watting at the various ports and so on, where the airdromes could be situated quite close to the terminal stations. Owing to the variation in weather conditions, there would be of course some latitude in the time of arrival at the destination but in those cases where there is a saving of several days in the total journey to be of much account.

Much more could be written on the time-saving and other features of the serial transport

service proposed, for the engineers have gone down to the very bed rock of all the factors entering into the operation of the durighbs. They have figured out the costs to a nicety even including the costs of averhauling andrepairing, insurance preniums, depreciation, interests on capital invested, fuel, row, and so on

But from the viewpoint of the layman the interest now shifts to the oraft to be employed. After all, it is the dirigible covering the route which deserves particular attention, since all plans stand or fall by the practicability of the

#### A Greyhound of the Skies

In brief, the proposed rigid dirigible, which is herewith illustrated as well as in the cover illustration of this number,

cover illustration of the number, the same the following characteristics. Gross gas capacity, 1500 (201). So the feet overall length, 500 (201). So the feet overall width, 100 feet, overall height, 105 feet, total lift de Be pounds per 1,000 cubr feet). 105 tons, disposal lift, 68 tuns, total maximum power of engines, 3500 horse-power runsing horse-power, 2,000, speed at full power, 150 miles per hour, speed are running power, 60 miles per hour, and traught, 300 hourse for 4,800 and fraught, 30 hours for 4,800 tons of passengers and fraught, 30 hours for 5,00 miles for the same per hour speed to tons of passengers and fraught, 300 hours for 5,000 miles

It should be noted that the "disposal fit" is the lift available for fuel and oil, stores, rew and passengers, mults, and freight The particulars and performance attack are based on pure at desagn, and the actual performance of shaps of 2,000,000 cubic fet capacity now in service It is believed that the figures given are conservative, and that actually the increased use of ship would enable greater structural efficiency and consequently greater dis-

enable greater structure encreavy
and consequently greater appreciate
possable lift available than that specified
The shape of the trans-titatut dirigible is to be of the
most perfect streamline form within the limitations of
constructional requirements. An internal keep do orridor,
running along the bottom of the bull, will afford access
to every part of the dirigible Petrol and oil tasks and
water ballast will be contained in the bull structure.
The outer covering would be made of special weather
and the contained in the bull structure
and the contained of the bull structure
and the special properties of the special properties

The gas capacity of the dirightle would be divided into gasbage made of suitable rubber-proofed cotton fabric lined with goldbacter's skim. The gas-bage would be fitted with automatic relief valves and handoutcolled masseuvering valves, operatod by the pilot outcolled masseuvering valves, operatod by the pilot

from the navigating quarters located well up forward. The engineers have plained on an amechanic rears or "power eggs", each contaming a 600-horse-power engine, and contaming a 600-horse-power engine, directly connected with a propeller little at the aft end. Thus the dirigible would have a maximum power of over 4,500 horse-power, the engine which give not divided by their maximum full power when flying at a bright of 5,000 feet. The engines would be fitted with special exhaust alternees in order 1 reduct the exhaust noises to a minimum, and special is unsaftration would be given to the traismission gear, cooling system, self-starting features, and so on

#### Promenade Decks and Salons Among the Clouds

But how about the hying quarters now that the mechanical details have been glained over?
Well the main living as animolations would be in a salon fitted along the top of the aniship provided with

The the no distant future captive balloons, equipped with electric lamps o high power, will mark important airdromes and landmarks for the aerial pilots of commercial and pleasure craft.

tables and chars in the style of a Pullman car when would enable the passengers to be confortably accommodated during the daythen. Part of this salon would be fire-proofest to allow of being used as a most coron. An open shelter de-k would also be provided at the aftend to enable the power are to take the aftend of the provided at the aftend to enable the power are to take the arms of the salon would be proved in white nations, giving the

A passenger els vator would be proved dor communication between the passengers quarters and the lower part of the ship. An observation as fitted below the hull towards the aft end of the ariselps would also enable passengers to observe the lead and sea mimediately below the ship. As for sleeping quarters those would be in the form of bertha prevailed in small cabins fitted on top of the huge hull, forward of the living asliums. Cooking would be done in a mess ketchen, thoroughly equipped with electrical coding apparatius. Meals

would be served in the salon. Heat for salons and sleeping quarters would be radiated by electric heaters. It is interesting to note that such a drigid be would be equipped with the last word in wireless apparatus, enabling it to keep in touch with land stations and ships, and also permitting of the reception of directional signals at all times. In fact directional wireless against today make it possible for on ariship to be publicly with considerable accuracy (v. m. if it is enshrouded in thick fogor is operature).

So much for the urship Bit how about the landing facilities? It has often been said of the dirigible that its fac better in the air time on the ground and that the problem of getting it up as nothing compared to the problem of getting it down-walked. Again we find that of bringing it down-walked. Again we find that the British engineers have done their work well and the British engineers have done their work well and the British engineers have done their work well and the British engineers. At the Granual point of each

archip and come points again a service make, provision for the following. Ist. An ardrome of shout one mile square. 2d. A double arrhip skid capable of housing two of the arrhips. 3d a mooring-out tower with how mooning gear 4th. Medianural huiling gear for transferring the mooning gear 4th. Medianural huiling gear for transferring the to the shid. 5th. Hisdrigen containty plant and storage of the Meteorological office and wiseless telegraph in the storage of the mooning tower to the singular different plant and storage of the mooning tower to the singular workshops and the storage of the mooning tower to the singular different plant and storage of the mooning arrangements for the ardrome. 9th.

Only the Common should be within their communication and a what diestance (from the city served by the arelings rave, and, if possible, would be advantage only situated near to a chimical works where hydrogen would be obtained as a bright common to the interesting to note that the British engineers have figured on hydrogen method of the common that is interesting to note that the British engineers have figured on hydrogen method of non-inflammable facilities although it as produced in the common through the common although it as the common through the common

place of the fermer.

In double whele required to house the sace of air-shipe called for would require two be rise and with a minimum size of 850 feet long 150 feet wide and 150 feet long 150 feet wide and life feet light, with opening doors. The sheeds would be provided with by drogen filling mains and will gar for slinging the air-ships from the roof when defaced for ments would be made to each senset would be made to each size ments would be made to each size ments would be made to really size of the ships with gos, for I and water ballar!

#### A Hitching Post for Dirigibles

Most interesting of all the airmore arrangements however in
the proposed moning-out scheme
which has been made the subject
of a paten by the British organination. This scheme which forms
the opening page subject of this
number would be introduced at
tach surdrome in the shape of a
fixed mooring tower about 150

feet in length, with a revolving head to which the archip would be rigidly attached by the nose and he able to turn round in accordance with the direction of the wind. In turner would be provided with a huiling in winch and rope to hall the ship up to the mosting point. Means would be provided at this mooring tower to enable the archip to be supplied with hydrogen fuel and ground to the top of the tower would enable passe agent to embark and thus mindre while the arriving was riding at the mooring, and would also serve to convey mails, freight, stores, etc. to the ship. The airship would the moored to this must aim ride out during even the worst washes, and would only require to be taken into the washes, and would only require to be taken into the his scheme is a level or exchanged and the scheme in a level or exchanged.

# World Markets for American Manufactures

Edned by LYNN W MEEKINS

A department devoted to the extension of American trade in foreign lands

#### Readjusted British Industries

A MIRICAN manufactor is whose plats were en-gaged in war work at fill wing will not rot the changes now going on in British fit res. It has proved cours an both the latted states and Great Britant return to a pice basis than it wis to go upon a werhoos. The striking ficting the little matry is the imbre of firms that have time by the pice has a the little matry is a right list hat are being map it let just he life for the inpany in I i stor used t leindle American exponenters at will make its own in a bases henceforth I rom the manufacture of valuante pressings for magnetos

an ther leacester from las change lats line to funtum poss r placing American makes. British plant that produced air planes f r war use or turning out furniture ir in vals s automobile i cossories capstan lathes in I marme in t rs. Great estab halmones from which continuous streams of munity us were p ured into I rance have been renverted for the manufacture of such articles as the trical fittings presses for bit kninking files and springs creain separators datry stensils shot machinery and locome tryes

No longer required to make millions of yar is of army cloth the British textile inclustry has readquated its louis and undertaken 1) regain its streng hild upon foreign and colonal unirkets. There has been a movement in Ingland for the enlargement of the or ducing units in order to reduce the manufacturing rost of th diversals d lines of cotton goods with which the natives of India China and other vast

ton natives or infinite and supplied Ler-consuming countries are supplied Ler-many usockets sell to British mills nearly all the hossery needles that they employed these are being made now by several former ministion plants in England. In con-nection with the restoration of French and Belgian textile industries a great dial of the necessary machinery will be sold by British in mufacturers whose equipment is already familiar to the owners of the looted or de-visitated factories on the Continent

One-third of our six billion dollars, worth of exports in 1918 went to the I nited Kingdom, which has been a constantly growing market for American goods. In dealing with our transationic customers we have the advantage of a common language and the benefit of

transportation Inst now the British Covernment is regulating the trade in a number of commodities in iking it necessary for importers of certain American products to obtain licenses but this restriction will be relaxed as the exchange situation improves in the five-year period preceding the war the I mited Kingdom bought Cerman goods valued nearly \$1 400 000 000 total m 1913 being over \$100 000 000 m excess of that in 1909. This business has come to the United States and we ought to keep most of it.

Many American manu-facturers have obtained a grishure of British trade hy cataliling branch futries icr so the cean. One

hrm that makes per goris
allowed five years to the working out of such an experi and well rest of the working out or such an experiment and I in I it so, essial within half that time.

Owing to the high r wages paid during the war the standard of hymn, in Creat Britain has improved to such an extent that Am a me expat recan sell more of our products there regar liess of the industrial changes that have been mentin l the demand is for standard lines inclining toward the luxury class

#### Exporting the Bolsheviki

"NEVER hant for trouble it will always come to you" is an old saying und even when not sought but merely expected that unwelcome visitor is likely

to appear. Upon the signing of the armistice it was freely predicted that we should have hard time as in this country, the radigatement to a peace basis involving curtailed prodiction and a great deal of unemployment. For-tunally, we were not in the war long to ough to make a vast amount of rearrangement accessary We did how-ever tune up our industries to such high speed that the domestic market is no longer capable of absorbing the output and those manufacturers who haven t gone into foreign helds are the chief sufferers

American goods are shipped from Atlantic, Pacific and Gulf ports unless they are sent to Canada or to

A British spinning will using American cotton

Mexico by rail, and around these ports is naturally centered most of the interest in our export trade. It is from inland factories, though, that a very large proportion of our export products comes and the more energy displayed by neumfacturers in the 'Middle West and in other sections the more speedily the United States as a whole will be placed upon a firm world trade base.

#### Keeping Our Workmen Busy

The first need of the American workingman today is stability of employment—the assurance of steady work," said a noted economist the other day. He proposes the passage of legislation compelling manufacturers to

Sweden used to be the principal source of supply for safety matches. The war handwapped Swedish mani-facturers shutting off their raw materials and taking away much of their shipping space. Along came Japan-and that leads us uto a sparsely settled region not far from Lake Michigan. Not long ago a paper mil in that section recovered a very large order for the particular kinds of paper used in making the little boxes in which safety matches are sold—for the exact kinds, in fact, that Swedish manufacturers employed-and this order was shipped to a large match factory in Japan Now, at least one company in the United States is producing

safety matches, but the quality of American products is so universally recognized that our manufacturers are not compelled to copy the packages of their foreign competitors in order to gain their share of the world a business

Incidentally, that one mill is turning out no less than 420 different kinds of wrapping paper, lots of them for export wrapping paper, tots of them for export "When the war began we were making two grades of a certain variety, each in seven weights, or 14 separate sorts of paper," the manager told me "The War Industries Board reduced the number to hve, which effected a real economy for us As soon as this emergency branch of the Government was discontinued the paper trade, instead of going ahead with the five lines, increased the number to 191 So, of course we have to supply them

#### An Expert Order and Its Result

He went on to say that before this mill had become interested in export orders he had found it almost impossible to develop an ambitious spirit among his employees We tried almost everyhad found it almost impossible to develop an ambitious spurt among his employees. We tred almost everything imagnable to induce the man lower down to suprice to the job higher up "he said. "Every now and then a bosus was given Working conditions were improved Many welfare plans were introduced. And still Henry Jones, receiving \$15 a week was satisfied to keep on drawing that amount instead of hough go promotion to a higher position. We were surprised one day to have a foreigner call at the mill. He was traveling through the United States and somebody had told him that we specialized in varpping paper, a line that he handled in South America. The result of that visit was a quite that the respectable order. After he

respectable order had placed it I gathered all our employees during the noon hour and gave them a plain talk

"'Heretofore we have been making paper for Brown & Smith of Chicago and for the X Y Green Company of Omaha' I said 'both of 'Heretofore of Omana I said both of them within a days railroad ride Once in a while our shipments to them have needed a little adjustment, which we could make easily and quickly Now we have and quickly Now we have an order from Elsenor & Garcia, of Buenos Aires, thousands of miles from here It's a trul order, and a pretty bug one at that I want this shipment to be all right in every respect. Each and every direction of the customer must be fol-

of the ouseomer must be followed absolutely. There so not to be any comeback on it!

"You would be surprised at the effect of those remarks. The men formed in little groups and I could see that they were decidedly interested. The paper that went to Argentian was exactly what Eleonor & Garon had specified, through thair representative, and it was pasked just right. Other orders followed, our coport business grow. In the reading room that we started through the proper many products. Now we feel that the proper monetive to dishe the ladder has been found." een found "

One of the largest and most up-to-date loom weaving sheds in Lancashire, using American cotton

pay an unemployment tax-50 cents a day to each man he is laid off on account of a slack in orders ever the merits of such a measure may be, it is certain that trouble would follow in its wake. The one great unemployment cure is foreign trude which means a conunemployment cure is foreign to the which means a con-tinuous flive of business and a maintained or increased working force. When the domestic market is dull, a harder driv may be made is I alin America or in the Far East. The point is that American products must be shipped abroad steadily and foreign fields must be sare-fully cultivated all the while. Export trade is not a matter of getting rid of a surplus. Our would eastoners want American quality goods backed by officient service

#### ring Erape don at the Panama Canal

order to study water supply con-Meons at the Panama Canal an evanorer has been established at Gatun Lake Sing is a copper pan, four feet in diameter, which is kept full of water and the quantity of water that has to be added from time to time measures the amount of moisture that is taken up by the atmosphere pan is carried by a raft which floats on the surface of the lake At one side of the raft there is an anemometer which keeps a record of the wind while on the opposite

saids is a rain gage
Evaporation at Gatun Lake is very
copious, despite the high humidity of that
region During the eight months of the region During the eight months of the rainy season it amounts to four inches per month and during the four dry months seven mohes per month. It must be re-membered that even in the dry season

ere are rains practically every day, and yes the evaporation is almost the same as that of the flatton Sea despite the ard surroundings of the latter body of water. The high evaporation at Panama is due to the heavy winds which are constantly

The evaporation station at Gatun Lake

#### Automatic Wireless Receiver Which Anyone Can Operate

THERE is much of the proverbial needle in a bay-stack problem in modern radie t kgraj by and telephony. Of nutters to be slorely tuned it been nor nutters to be slorely tuned it been nor necessary for each rest to be just us sharply tuned or alpest their case the meaning waves. This is neither the cuertor must capacitis and their civing components capacitis and Mort civing components so us constantly to so ur the intercrange of radio wave length. Only in this manner does it be one possible to text all calls and messages whether they be of a multiple of the source of the tary commercial a coursency nature

I ully realizing the possibility of a vessel calling for help in any arbitrary wave and not being heard by epirators in the immediate vieintly because they would not happen to be searching through all wave lengths at that moment, the framers of the radio laws have made it

compulsory for case is to operate their transmitters either on 300 er 800 meters. In this manner, they believed all wireless operators would be cirtain to hear distress calls

within their range for the reason that they within their range for the reason than they only had two places on their sets at which to listen in However the framers of the laws of the London Convention, in 1912 also massied that the transmitters should be sharply tuned. Thus it now happens that numerous stations in the same locality may be winding on the same wave length with the result that much inter-ference is caused. As matters have here tofore stood therefore at has been a matter of deciding between finding the proverbial middle in a haystacl by permitting trans-mitters to use any desired wave length or inviting under interference by insisting on the use of one or two standard wave

It has remained for Roy E Thompson a radio engineer of New York City to develop an automatic receiving set which makes it possible to explore through all the wave length ranges so that any transmitter may be detected without under trouble on the operators part. In other words using the sharpest (uned receiving ereuit hich makes for the most efficient results Mr. Thompson comploys an electric motor for mampulating the receiving components from the lowest to the highest range from the lowest to the inguest range at regular and recurring intervals. In fact his receiver may be likened to a searchlight the motor-driven receiving set—sweeps the ether so to speak in the same way as a searchlight sweeps the horizon. This means that there must be a gradual and continu ous sweep from the shortest to the longest ous sweep from the shortest to the longest wave length within the range of the instru-ment. Thus all wave lengths are tuned for in the course of a each of operation, and when the operator detects signals which he

desires to receive at length he can stop the operation at that point as long as may be necessary Briefly, Mr Thompson's automata receiving set or

uni-control reserver as he calls it consists of a more or less conventional

circuit comprising inquetance by many turns and Iv single turns at variable condenser phone receivers the fixed condenser detectors and so OH

trolling the indu tances together with the condenser are continuously oper ated by means of a train of gears driven by an chetric motor through a flexible Lhus the combination of inductance and ca pacity is such as to (Conf d on page 417)

Interior and exterior views of the automatically-operated receiving set

#### Peace Uses of Gas Masks

A MONG the many articles of war squipment that have little or no use a squipment that have little or no use in time of peace gas masks hold a promi-ment place. Being of rubber they will not keep for an indefinite period of time and they cannot be stored away for use in some sucy cannot be stored away for use in some future war. Accordingly our soldiers are allowed to keep their masks as mementos of the great war and the public can buy them as souvenirs from the Chemical Warfare Service

There is the danger, however, that these asks may be put to uses for which they re not at all adapted — It is quite natural for the public to assume that masks which for the public to assume that masks which have stood up against all the deadly poisons which German ounning could devise to overwhelm our men, would surely afford adequate protection against any gas that might be encountered in our industries might be encountered in our industries. But such is not the case. There were certain gases which the Germans could not use because they are so light that they would rise quickly and would readily be ed in the atmosphere | There were dusipa commonly found in chemical works. Fur-sommonly found in chemical works. thermore, it was never possible to obtain in the open battle field the high concen-tration that is often to be found in enclosed

The present filling of the canisters gives no protection against carbon monoxe practically none against aminonia fumes
The Chemical Warfare bervice does not guarantee

perfect protection in heavy smoke such as is sometimes produced in a burning building, since no tests have been made in that line but undoubtedly it would be of con-

suderable service in such conditions
The life of the cannister filling is also a problem. It is believed that if kept in a dry place it should be of ionaderable protective value for a year, but the only way of being sure is to test the helmet in a gas-filled room. If it fails a new canistes may be purchased from the Chemical War Service Eviary gas masks dustrial service

## The Motor-Driven Commercial Vehicle

This department in decoded to the interests of preast and prespective owners of motor trucks and desvery vagons. The editor will endouser to answer only quality relating to mechanical features operation and minagement of commercial motor schicles.

#### A Modern Gypsy (aravan

A RI SIDI NI of I is Angeles decited he would like to teur the United States gypsy fashion yet he dishked to frego the pleasure and confrts 11 n ring one pressure and control of a The problem was solve it his sit-taction by disigning special violation and installing it on a light track of issue the best statement. The driver's compartment is well enclosed and serves as a front half or entrance to the

#### Tractors for Hauling Airplanes

Till airplanes that were available at the outbreak of the war were not very large or heavy and could be easily handled by a few men and moved around thandred by a rewinder and motion of great deficulty. A great advance has been noted in aircraft design and airplanes of the triplane type with 120-foot spread and flying boats of even greater size are now commonplace. The weight of these large eraft produdes any attempt to mancuver eraft produces any attempt to manchest them by man power yet they must be brought out of their bangars to the flying field and returned to their risting places. when they have completed their flights Horses and automolides were

tried and found wanting so agricultural tractors of the agricultural tractors of the track laying type were finally resorted to and were found ideal for the purpose. The night handing squad-rons equipped with Handley

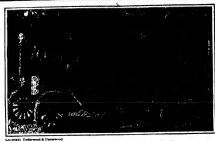

Page machines on the Albed front all had a small tractor as part of the maintenance and operation supply outlit and a very important adjunct they proved to be in towing huge machines weighing tons around on the muddy fields of trance The track laying tractor is ideal for this pur pose because it provide maximum traction without cotting up the surface of the field is a wholed trutor would when eleated or spiked traction inembers were spiked traction increases were included. The ampany ing illustration shows the utility of a tractor truck laving track laving traction members when sighed to hading out a fill large hading interaction of the large

## Heavy Traffic on New York Streets

IN an address befor the American Road Builders Association ( M Pinckney, Chief Engineer | Highways for

A house body mounted on a light truck chausis

the Borough of Manhattan gave some tigures that are interesting in connection with the heavy traffic under his charge

the average weight which the Man-hattan engineers have found was imposed on these streets is from 190 to 200 tons for each square foot of surface on moder atoly used highways such is Spring and Worth Streets the Bowery and Central Park West On such stricts as Chain-bus (anal Hudson and Lafayette the weight is from 200 to 300 tons and on the more congested thoroughfures. West, South and Delanty streets and parts of Eighth Avenue the load averages from 100 to 400 tons. At some periods of the

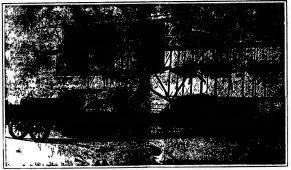

tion is laid to a depth of six inches, and the average breakage or eaving in has increased slowly in the last five years, having been 5/100 of one per cent in 1913 8/100 of one per cent in 1917, and 12/100 if one per cent in 1918

The anunal cost at present to restore the annual cost at present to restore the caved in sections is about \$30,000, Mr Pin kiny explained. The highway department has considered the advisability of mixing the concrete depths. thicker but to do this it was found that the mittal cost would range from \$100 000 to \$200 000 and solely as a matter of economy the city authorities have decimed it wiser to repair the breaks at \$40,000 over a path eight feet wide and travels at the rate of four to aix miles per hour. The slower speed is used in congested districts or when there is considerable refuse to be removed, the higher speed in residential districts where there dirt and where the streets are apt to be It is said that this machine has a canacity of 50 miles of pavement, eight feet wide in eight hours and the cost of accomplishing this work is about \$3

The engine is rated at 45 horse and drives the front wheels, which are of extra wide tread and are used only as tractive members. Steering is accom-plished by the single rear wheel which is mounted in a special fork construction As the machine runs on three wheels, it can turn around in a very small circle The broom and elevating mechanism engine has four cylinders with a bore of 424 inches and delivers its rated horse-power at 15k0 revolutions per minute The transmission system includes a 50 horse-power clutch, a three speed selective sliding gearest with differential included in the same case or housing in which the broom and conveyor shaft gears operate. The broom and elevator have two speeds independent of that of the machine. The broom has a diameter of 34 inches when new and can be worn down to a diameter of 21 inches before it clases to be effective

The water tank may be filled from any convenient hydrant once or twice an hour and the distribution can be regulated by varying the air pressure which forces

the water through the me conveniently to the driver seat The sweepings are held by a hopper which has a capacity of about three cubic yards, which is said to permit an hour s run under average conditions and can be easily emptied when filled by a dumping lever at the driver's feet The dirt conveyor is a revolving belt, extending the full width of the broom. The cost of cleaning has been reduced from 33 cents per 1,000 square yards to 12 cents by the use of this machine

A tractor-truck haufing a big scapiane to its hangar

day for a period of eight hours, West Street accepted on eight money, while the lasy section of Fifth Avenue, north of 23d Street accepted 550 tons in Winter dropping to about 250 tons in Summer

The engineers, and Mr Pinckney, is making the problem of producing strong foundations for the road surface a most senious one. Of the three types of foundation material namely concrete, old stone pavement and macadam, con-Borough has 154 miles of road surface laid on concrete 101 miles on stone and the road problem of New York is rendered all the more difficult, Mr Prockney pointed out, from the fact that about 150 000 square yards of road surface is torn up every year for repairs to conduit systems beneath the roadways

#### Power Street Sweeper

Till authorities of Boise City, Idaho, use power street sweeping machines of special design that are each capable of dong the work of three animal drawn outfits and corresponding gangs of work-men for operating and removing the sweepings This is a gasoline engine driven street cleaning mechanism that sprinkles, sweeps and collects the refuse

#### Hauling"Kosher" Meats by Motor Truck

A RATHER unusual, but no loss practical use of the motor truck is the solution of a perplexing problem in meat delivery "I his con-sists of hauling "kosher" meat from the abattours in Philadelphia to the Jewash markets of New York's down-town districts There is need

for haste in this work because the meat must be delivered to the retailer within twelve hours after it leaves the butcher's hands as the religious rule is that it must be eaten within twenty-four hours of the killing to be strictly "kosher' The truck running time between Philadelphia and New York is 10 hours so it will be evident it takes some speed to make deliveries to the "kosher' butcher shops in the 12-hour period Great reliability truck operation is called for and strice adherence to schedule as it would not do to have the meat turn from "kosher" to that of "trefa" because of delay. which latter condition renders the ment unsalable to the Jewish trade

ingly when you look for that Triangle B. Several thousand men have worked

fifty years to make it worth looking for.

First Commercial Drop Forging Plant in America

\*\*THE STOR THAT NOLDS ITS SEADS\*

\$4.00 \$4.50 \$5.00 \$6.00 \$7.00 \$ \$8.00

If you have been paying \$10.00 to \$12.00 for fine been, a tral will convince you that for style, comfort and service W.L. Douglas \$7.00 and \$8.00 shoes are equally as good and will give excellent saturfaction. The actual value is determined and the retail price faced at the factory before W.L. Douglas name and the retail price is stamped on the bottom. The stamped price is W.L. Douglas personal guar-

antee that the shoes are always worth the price 313,504 paid for them. The retail prices are the same everywhere. They cost no more in San Francisco than they do in New York.

Cost no more in San Francisco than they do in New 3. Stamping the price on every pair of shoes as a protection against high prices and unreasonable profits is only one example of the constant endiavor of W.L.Douglas to protect his cautomers. If a quality of W. Douglas product is guranteed by more than 40 years experience is making fine shoes. The smart styles are the leaders in the fashion centers of America. They are made in a well-oquipped factory at Brockton, Mans., by the highest paid, skilled shoemakers under the direction and supervision of experienced men, all working with an honoset determination to make the best shoes for the price that money can buy.

CAUTION—Before you buy be sure W L.Douglas name and the retail price is stamped on the bottom and the inside top facing. If the stamped price has been mutilated, B E W A RE OF FRAUD.

# Real People

THAT'S what the doughboys called The Salvation Army workers on the battle-fields and back of the lines in France

They were 'real people' to the soldier, because they were just like the folks back home with hands accustomed to work and eves always ready to smile

And now these same 'real people' back from the war with new laurels have built their trenches in the Streets of Poverty in America They well wage the fight for the poor and unfortunate at home just as they have done for years, only on a larger scale. The Salvation Army conducts Reacue Homes—Day Nureries—Homes for the Helpless Aged Lodging Houses for the Down and Outers—Fresh Air Farms—Free Chines.

It must extend this service everywhere where Misery and Poverty exist. It must continue to reach down and lift up the men, women and children who have fallen

## Will You Help?

#### War Credits

In those days when we hear so much of what the war has cost it may serve some useful purpose if we set down in a gentral way a few of the things we seem to have gained. We refer to some of the gains which are of importance although secondary to the principles which have been sustained political upbesvals and gorgraphical boundary changes.

Regarding and the property of the second bear fails in prints on scientific advancement and mechanical development. War is a time of great simulation in many directions and new nituations call for great invariant. We one evidet to war for the inception of the sugar-from-bests industry for it was only when the importance of an engar from the usual sources was cut off during the Napoleonic wars that I rance looked to the sugar best. It was then inferior in sugar context and purity to the roots now used and developed of work, has been done to increase the practicage of the sugar in the best recovered in the factories. A little while lefors the war sugar boots were furnishing about 60 pir cent of the world a supply So far as America is concerned the European war wrought several changes in the same industry giving rise to the production of sugar bet seed in the United States the prifection of best sheing kniese for the singer factories and the recovery of potable from the waste best molasses, also in which might have the Makes placed in the unique of the way to be the production of the sugar factories and the recovery of potable from the waste best molasses, also in which might have the Makes placed in the unique that we want to be supplied to the might have the supplied in the supplied to the supplied

War

#### Science and the War

The Furopean War may be credited with having awakened what bude fair to become a red interest in a stentific and industrial as a red interest in a stentific near discovery of a few amentific facts and their practical application have a greater bearing up in the world's future than most of the phites that seem so important to many Prinags we may be coming into a chemical and engineering age in which friendly instinus will work in closer cooperation than ever boffer. In July, 1915, Great Britain established the Council for Scientific and Industrial Research, ancee which time as large number of researches of industrial importance have been conducted funds have here provided for student continuity to the contraction of the provided funds have here provided for student or similar lines of manufacture and a great million-pound fund setablished by the government from which, under certain restrictions, pound for pound, may be contributed to those associations, conducting approved studies Canada, Australia New Zealand, South Africa and Tladia have followed closely after the

mother country in organising councils white smaller subdivisions of the British Empire are preparing to make the mest of research

In our own sountry the National Research Council was established in 1976 sunder the amprices of the National Australy of Stomess and after valuable service both before and during the war, is planting an ambitum program for contrased institutes. Steps have been taken to join an ambitum program for contrased institutes in certain phases of research work and much of real benefit to midsarry may be confidently expected Manning to the contrast of 
#### Development of Invention

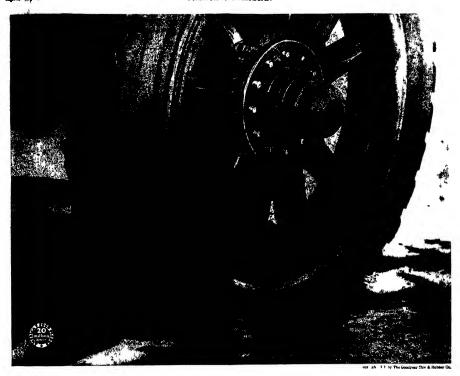

Closely allied with research has been the trials which new inventions and processes received years ahead of their normal time Several things thought impossible have been found to work and our ideas of what is impossible have changed materially Processes which private concerns for one or another reason might not have considered, have been demonstrated under government control, and we have as a result, such romarkable performances as those of the helium plants in Texas. Without the great demand for nectone in smokeless powder manufacture it magit have been vears before a large plant would have worked out the bechnque of producing worked out the bechnque of producing worked out the bechnque of producing considerations of the control of the control of the control of the work of the development of the synthetic method

#### Development of Our Natural Resource

We have taken a new interest in our national resources, too We know that radium bearing ores are to be found within our border and are not confined to Germany and Austria. Indeed we are informed that much of the rin' European' ore was carried there from Colorado The Bureau of Minnes with the coloperation of certain public minded citizens soon remarked the matter and established the remarked to the remarked that the coloperation of certain public matter and manageness have been produced in abundance our magnesite has proven its worth and from American clays the glass pot makers have fashioned satisfactory pole, heretofore only made with the help of imported materials. The search has been for specific recourses and funds have been available for necessary preliminary work while the emergency under which we found correctives.

More consecuently we have learned that More para a mumeral from which primare and to the control of the control

(Constitued on page 46)

GOODYEAR Pneumatic Cord Truck Tires are not only helping our trucks to last longer but they are lasting remarkably long themselves We find that their strength properly conserved, means exceptional mileage "-G N Burg for M Burg & Sons, St Paul, Minn

A SET of Goodyear Pneumatic Cord Truck Tires has averaged 22 450 miles per tire on a motor truck owned by these wholesale furniture merchants. The odometer already had checked off 20,000 miles before the first two tires were replaced while the third reached 22,450 and the fourth ran past 27 800

Of course, mileages of 15 000 to 25,000 are seldom ob tained where tires are abused or neglected. This particular record reflects reasonable care given these tires. Nevertheless they made their good scores despite being obliged frequently to carry full loads over bad railroad crossings and through unpawed and littered streets.

The company recently announced that Goodyear Pneumatic Cord Truck Tires have replaced solid tires on all their trucks. This is both because of the endurance of the big Goodyear Cords and the fact that they have minimized mechanical trouble lessened breakages in furniture covered more ground eliminated wintertime delays and reduced fuel and oil consumption.

Therefore this user like many others has benefited very delimitely fix in each of the pronounced virtues of G (dwear Pneu) and Cord Truck Tires—namely, their toughness traction, cushioning and wider radius of action

know that they can be, and we welcome these valuable new additions to the class of scientific instruments upon which so much ends in industrial progress

Bondes discovering some raw materials and making various intermediates we have found that the American mechanic is capalle of meeting any emergency and war much it micessary for many thousands to acquire skill which might never have been realized otherwise. Our marloquets in lirge numbers became accustomed to working within extremely small limits with pression of our work should be much greater Quantity production has always been the American specialty to which we may new add a higher order of workman-

#### Chemical Independence

rapidity and completeness with which we have provided ourselves with key industries must give the Gorman captain of industry the blucs whenever mentioned flow long and furthfully the Corman scientist and manufacturer worked to convince us that we lacked raw materials bud months sent technical skill and were without the ability to organize and manage such industries! I oday we have a chemiheavy chemicals in which we have always been strong many organic pharmaceutical near strong many organic pharmaceutical and swith the bodies which result from risear h f the first order. How long we should have had to writ for such independent but for the war, no one knows I did we have our own chemical glassware and p ralam stoneware and fused We are refining our own rare metals and where is very little if any optical glass wis ji duced before 1914 we are today in a p sitim to export that essential comm lety. Our dye industry has risen from a min r cille tion of assembling plants and those working from imported intermediates te i ging concern with some three hundred millions invested having ac-implished this development under the must trying conditions as regards labor and raw uniterials some of which simply could not be had while then was need of exof service

He w would you like to he ar the Chemical of Carmin goods into our market and to priter those American manufacturers who are hensed by it to work under these account I German potents. Thus through one f the most constructive pieces of work the with has brought out the very German pitents designed to protect (erman interests against all comers in our market, tees agents all comits in our market, been set flexive defence in American hands of our new industry!

Ans surplus carnings of the Toundation and evaporated milk so the European war after the preferred stock is retired will be

introgen has received onathrespheric introgen has received as advantage of saving about 80 per cent in coursaginust in our country in a measure volume and 90 per cent in weight besides which only a war extreme necessity spoilage (16, over our present methods could impart. The synthetic process.) And where chammetry, physics, mechanisms and the saving of the spoilage (16, over our present methods could be another than a severity-five necessary spoilage (16, over our present methods while more than exercity-five nellions have while more than exercity-five nellions have been invested in plants operating by two or readed as a war device, and applied in the methods By-product coke oversight of the methods By-product coke oversight of the methods by-product coke oversight of the method of the methods. gaining on the wasteful bechive In 1917

the beshives gave us 83,107,548 sons of coke and 80,406,000 in 1918, while it 1917 the by-product overse produced 22,204,000 in 1918. The gran has and 28,204,000 in 1918. The gran has has shown the economy of stripping as

And what of our infant potash industry? True fumes and dust were being precipi-tated from cement mill flues in order to protect surrounding vegetation, but it has taken the war to encourage a spread of the practice and to arouse interest in making potash a valuable by-product of blast maximum production so that in future the furnace operations winning it from signific and developing by-products from kelp, which may make it possible for the potsab-from-kelp industry to survive in normal

> In Germany cellulose chemistry must have made great strides for wood consti-tuted about the only source of this building material of nature, the form of which has always excreed such an influence upon envilration in each locality Explosives from wood in place of cotton paper tex-tiles, wider use of hard fiber—all go back to the chi mistry of cellulose. Here, to con-serve fats, we learned how to make glycerme by the fermentation of glucose or starches the end products being alcohol and glycerine and the cheap process seems to have come to stay It required a war to fully quicken such inventive genus

### War Gases and Peace Industri

The war led to a real study of gases and now we know something of their use, control production and how to handle them with safety. This will lead to better protection in mine rescue work, in fire fighting and in applying disinfecting measures. There should be less danger in handling ammonia where a concentration of 4 per cent in the air soon produces a burning of the skin. We have throughout the country more men who know something of gas technique and can act as new centers of information. Then we have made the acquaintance of new gases which seem to have commercial possibilities. These gases are available in quantity for experiments and that always means new uses Thus phosgene which used to cost about \$1.50 may now be had at say 10 cents at which figure it becomes attractive for such uses It is will'd you like to last the Chemical figure it becomes attractive for such uses cloud-time in the discussed in Germany? I as the removal of iron from sand wanted it is expected that this Loundation the for optical glass. Phosgene (earbony) as k f whi is is distributed unough the charged wherean companies and to it removes the outdeep year form thoride with is oun 1500 enemy patient have been as the course of the proposed of the proposed from channel at 1 with hashe to prevail the dumping I von small traces of tron cannot be prevailed to the course of the proposed from the proposed of the course of the cou greenish color iron imparts and this method for its climination seems promising
It is also barely possible that some

may be useful against rodents and the like, their disappearance from the trenches being one of the few blessings of a gas attack

has introduced dry milk to many although after the preferred wtork is retirred will be line introduced dry milk to many although divited to research thus greatly strongths the howing once have been using it for sening the very industries the German lyers. Properly dried milk is easily soluted that I he war is surely responsible for such that I he war is surely responsible for such milk the lactone the protein and as much Frantion of Atmospheric Nitrogen.

A new process for the production of promise and a rapidly approaching necessarily to the provider with the proposed of great variety of these major and a surely of the proposed of great variety of these major and a sequely of the proposed of great variety of these major and a sequely of the proposed of great variety of these major and a sequely of the proposed of great variety of these major and a sequely of the proposed of great variety of these major and a sequely of the proposed of great variety o A new process for the production of promise and a rapidly approaching neces-vanide upon which chemical so many sity for the majority of those in densely mining pixting desaming and hardening populated areas. Dehydrated vegetables, much als depend has experient id commer-cial development while the fixation of aided by war and we may soon learn the many as yet imperfect, are also upon us nided by war and we may soon learn the advantage of saving about 80 per cent

# The Hartford's Greatest Service is the Prevention of Fires

A policy in the Hartford Fire Insurance Company means to a large degree insurance against fire. Insurance against fire is a very different thing from fire insurance.

Naturally you want both. You do not want a fire at all if it can be avoided. If you do have a fire, you want the insurance money paid promptly and fully. The Hartford doesn't want a customer who does not consider a fire a great calamity, even when fully insured. It wants to insure only the man who takes out fire insurance as a preparation for the worst, and who will cooperate with the company and its agents in keeping the worst from happening.

When we write a policy of insurance on a property, we reserve the right to examine every element that affects the risk.

One essential element is the character of the insured. The character plays a large part in insurance, just as it does in banking.

Our care in selecting risks—our careful consideration of the hazards involved—our co-operation with the insured in preventing a fire—constitute the most important service the Hartford renders—more important even than the payment of losses.

It is done in the interest of our policy holders because such a service protects the property owner from losses that his policy can never make good. The experience of our inspectors and agents is at your service to aid you in avoiding fires, just as the resources of the Company are at your service in fully and promptly paying any fire loss.

Any agent or broker can get you a policy in the

The Two Hartfords—the Hartford Fire Insurance Co. and the Hartford Accident & Indemnity Co. write practically every form of insurance except life.

tumbling and scraping action to the trips dur such course and carrying off by floatsten transous matter freed from the trips, the wy being done mechanically instead of by hand

FOLDING (O1—J LUPPING 1668 85th St Brooklyn N Y The invention relates to furniture its object is to provide a folding cot which can be readily folded to take up vary little which can be readily folded to take up way lived recent for storing shipping or other purposes or which can be extended without much physical exerction on the part of the operator the oot when in extended position having its parts securely locked to prevent accidental folding COLLAR BAR — 8 Sameson 2 E 23d St

COLLAR HAR—8 Nameson 2 E 28th Rt. New York N Y Among the principal objects of the invention are to provide simple means for preventing failure of the meeting ends of a collar to bold the colla finally to avoid marring the exposed surfaces of the collar where it is gripped by the bar and to provide means for holding a necktie in proper position

necktich proper position
HOLLOW (OINFE BLOCK—F Havra
1001 McCormick Bilg Obleago III The in
vention relative to hollow corner blocks for use in
hollow wall ronstruction. An object is to form
a block for constructing corner of walls jambs
of openings and for building piers which will
inake a more sightly corner Each blocks in common use and will give a pressure steeping whee
boult in a wall than ordinary corner blocks go.

POWDER CONTAINER -O E ANDRESO PUWDER CONTAINER—O E Arcusseous Ja 486 Commercial St. Ascrota. One The Invention relates more particularly to a dispensing container for various uses the edipter possing container for various uses the edipter container. The property of the dispension operation may be accomplished reddly and quickly and a proper supply of powder ascendinct and travelly and active stands at all times to the device may be mounted in runner time with a wall bracket, and the like at any convenient point.

LADDER STAY -- J MARWELL 108 W 48d 8t New York N 1 care Elk Club The invention has for its object to provide a construc-tion of stay member capable of attachment to invention has two to dispect by provide a construction of state mental consistent of attachment to substantially any ladder and of adjustment to substantially any ladder and of adjustment to cocae with this lower end theoret to prevent siding. Another object is to provide a stay as formed as to be rotatably mentaled on one of the rungs when it is the supporting less of the sides of the faller.

COMBINED PIELD GLASS AND RANGE FINDER—B R lotty 128 Fayetteville St Raleigh N ( An object of the invention is to provide a combined field glass and range finder invoide a cottoblaced field glass and range finder which can be meet for one purpose or the cother or both and which those not take up any more room when folded than an ordinary telescope. A further object is to provide a field glass and range finder in which the range may be approximately determined by a single observer and a device of such form that it may be fished and stored away to support the control of the control o in the pocket

REINFORCING ELEMENT FOR CEMENT AND CONCRETE WORK -F G JORDAN 200 Indiana Ave Washington D C The invention relates particularly to a reinforcement for walls relates particularly to a reinforcement for walls and structures of control capable of effective effects (abriculture of control capable) and effective effects (abriculture and without the use of boils and other connections and without requiring particular tools or especial skill its extension therewish has object is to provide intervitions theretizous fix the tensest or concrete whereby to form a strong union and effective bond

BANITARY MILK MEASURE —W SMITH SN W Lincoln Ave Mount Vernon 1 This invention relates to measuring and dis ing devices for milk it has for an object the proing devices for milk it has for an object the pro-vision of a construction wherein an accurate quan ity may be quickly measured and dis-pensed at the same time. Another object is to provide a measuring device which may be hodily set into an ordinary milk can and operated quickly without impairing its accuracy.

COLLAPSIBLE LEAD PENCIL HOUSING COLLAPSHILL LEAD PENCIL HOUSTNG
—— REALEM 22% WORRS New York NY
An object of the invention is to purple a simple
construction which is obserced-rated by its significant
when the pencil housing is fully exceeded. The
housing comprises the sections, each formed of a
pair of spaced concentrate tubes tunted give a sent
at one set a lead grip associated with the setreams exciton such a such for expending the setreams exciton when the housing it collapsed.

material has to be conveyed, is such that other forms of transportation are impractical, the overhead Wire ramway comes into its own. It is aerial transport. ation in practical economical form.

Miles of Wire Rope Tramways were rigged up in the Italian Alps for the transportation of troops, food, clothing and munitions A line of communication was thus estab. lished which otherwise would have been

is making good But vesterday the Ger-mans were trying to capture the mechanism intact so great was their wonderment at what could be accomplished with it By the wider application in a commercial way of some of the submarine detecting dovices it may soon be possible to make collision with ships a thing of the past and disasterfrom derelicts recepts and other floating dangers quite unheard of the same devices may be used also in locating sunken vessels so that attempts at raising them may be made and meditecting the mearness and location of reefs the shore and any object of size in the water. Such was inventions will be of permanent and increasing value

#### Hydroelectric Power Plants

It is to be hoped that the war s fuel crisis will lead to a wider use of our hydroclectric power of which 3 per cent has been devel oped and the carly introduction of th great central power plant plan which proposes more efficient use of fuel near its by common arriver lines The strement is made that for every 5 900 000 000 hydrolectre horse-power put to work we save about 17 000 000 time of fuel annually and release for other employment 100 000 of the men who spent their lives following coal around from the bowels of the earth to the ash pile. Italy and France are making progress in using their water power while here since 1993, things have been waiting for a few technicalities to be

The influence upon our scientific teaching can hardly fail to be beneficial providing those responsible for the business management of educational matitutions take account of the accessity for proper salaries. The faculties of nearly all schools have been shaken from their traditional ruts many men have had to resume new responsibility and still others have had business and practical experience of great value Feachers and students able have had many opportunities for research much of it in the great field of organic chemistry in which we Americans had not been as profesent as we shall henceforth become

#### Surveying from the Sky

A host of war problems the solution of which might mean benefits in peace remain incompletely solved, and still newer ones have been uncovered. Thus the airplane will no doubt be widely used from now on in making topographical surveys quicker and more accurately than by older methods— Arphane cameras with lenses of 50-meh forus and elever mechan-cal devices have been provided for such work, and they proved their worth on the western front, where in 1918 more than 250,000 negatives were taken by the British aumen alone. But we shall continuc to have airplane problems for chemistry to solve such as a fuel for use at high altitudes, when oxygen is so scarce that gasoline will not give satisfactory com Something is needed such that it will not only be a valuable fuel for internal combustion engines but in burning will liberate oxygen for the combustion of other ingredients of the mixture

Let us learn our lesson well and remem-ber it. We should not require a war to awaken and stimulate us. Now that we have made a creditable beginning let us continue with full attention to cuoperation education and research. It is the discovery and application of scientific truths that count large in the world's progre

## The Current Supplement

WIRELESS telegraphy was sufficiently wonderful when it was new and wonderful when it was new and imperfectly understood, what then shall we say of wireless telephony, which pro-jects through the ether, not arbitrary signals, but the actual human voice? # **Automobile Welding** with the Oxy-Acetyleme Flame

By M. KEITH DUNHAM

167 Pages

Price \$1.25 By mail \$1.30 Fully Illustrated

This is the only complete book on the "why" and "how" of Welding with the Oxy-Acetylene Flame, and from its pages one can gain information so that he can weld anything that comes along.

No man can afford to be without this concise book, as it first explains the apparatus to be used, and then covers in detail the actual welding of all automobile parts The welding of aluminum, cast iron, steel, copper, brass and malleable iron are clearly explained as well as the proper way co burn the carbon out of the combustion head of the motor.

#### SCIENTIFIC AMERICAN PUBLISHING CO. Woolworth Building

into the domain of cold, herd facts have been concentrated in the years of the war. Once assemi and as a consequence the story has never been told in connected form. A summary forth over been told in connected form. A summary of the briefest sort appeared last week in these pages; and beginning with the current same. No 2259, for April 19th, we earry in the SUPLIEBLET the complete story of Ratic Telephony, in three installments, as told by two of the men who have been among those active in the work, Other articles possess almost equal interest.

There is the discussion of Molecular Association and Chemical Combination, in which French authority gives his views as to the relation between the forces of ordinary coheson and of chemical affinity. In somewhat lighter vein is the profusely illustrated account of Familiar Insects through the Camera. Mr. Hurley's exceedingly able discussion of the shipping situachance and Electricity, Professor Franklin of Technology presents an extremely striking array of analogies between mechanical and electrical action. The various answers given by scientists of various branches to the long-standing question, How Old Is the World? are collated and compared Shorter discussions of interest include The Industrial Use and Limitations of Respirators, Gas Masks and Oxygen Breathing Apparatus, and Widening Do-mand for Blust Furnace Slag

#### Floating Mines in the North Atlantic and the Arctic Ocean

by me in my investigation have been at the various points of the Atlantic Orean here mentioned, after the lapse of 10 or even 20 years—It should be rememdered or even 20 years It should be tememorered however, that the mines tend to disappear more rapidly than the floats because of their automatic destruction.

The coasts of the United States are pro-

tected against these instruments of danger, coming from Europe by the polar current which flows from the north toward the coast of Florids. Such are the conclusions to which I have been led by my occanographic studies and which I now wish to apply to the safeguarding of the navigators who may still be menaced long after the signing of the articles of peace by the genus of the "frank and joyous" war.

#### Locating Unexploded Shells on the Battlefields of France

(Continued from page 395)

the location of fragments of shot, previous to operation The first experiment of this sort was made in 1881 upon President Garfield, and the balance at once located

the hultet, which had eluded all probing.

The "Alpha" machine of Professor
Guitton comprises two large wooden rings,
upon each of which are mounted two coils
of wire, the one traversed by a variable
current, the other in circuit with a telephone. The second coils in both passes are The second coils in both cases are in circuit with the same instrument; and e connections are so arranged that the electromotive forces respectively induced in the telephone by the two variable cur-

rents are in opposite senses.
Under these conditions, if the two pairs of coals are identical, and if there is no metallic object in the immediate neighborhood to introduce perturbations, the two electromotive forces compensate exactly and no current is produced in the telephone circuit. The instrument accordingly remains silent. But on the contrary, when the apparatus approaches anything of metal, the induced currents are such, under the modification of the magnetic field thus caused, that the electric symmetry of the system is destroyed and the telephone gives off sound.

off sound.

The apparatus can be taken down for live only plans for a bridge which were packing and transport. It is controlled by means of two small cold inserted in the Moderate of the Mod

is obtained in the tele calibrated, the operator walks back forth over the ground to be tested: assistant follows, carrying in a small | the induction coll which supplies the

n. this way it is possible to discover a metallic mass of as much as 10 kilograms at a distance of 40 or 50 centimeters, or a smaller fragment at 25 or 30 centimaters. But the sound given out by the telephone is to all intents and purposes the same in either case, for its intensity is directly proportional to the mass of metal in question and inversely proportional to the depth at which this mass lise. Incomplete information is thus the best that can be had, and it becomes necessary to remove the overlying earth in every case with the care that would be employed if it were known that a greande was buried at a depth of only a few centimeters. Moreover, operation is rather slow. Professor Guitchen estimates that it would take about three hours to explore thoroughly the smaller fragment at 25 or 30 centimeters. three hours to explore thoroughly the surface of one hectare (2½ acres); others insist that this time is altogether too short for the task. So while capable of rendering good service, the instrument is apparently not the last word in the solution of this extremely complicated problem.

#### The French Problem of Reconstruction\_I

(Continued from page 297)

in his own town almost invariably, if she is to marry a farmer, because to marry one in the next town will be to have two farms too far apart to attend tol

To rebuild a ruined town alongside the ruins would mean that some one would have to give up his land—his cherished

Aye, someone—but who would do it?
Why should Pierre and Monte, and Henri
and Jules give up their land? "Liberty,
Equality, Fraternity"—words that have
blessed France many times are sometimes breaced render many times are sometimes her curse. No, the little towns will be rebuilt where they stood or not rebuilt; and that makes both an engineering and an economic problem, neither of them easy

### The English Channel Tunnel

(Continued from page 399)

government always warmly endorsed the

Hawkshaw's design called for a single double-track tunnel, the boring being 36 feet in diameter and the finished internal diameter 30 feet. Its length was to be 31 miles and its cost \$40,000,000. Much study miles and its cost \$40,000,000. Much study was given to the question of ventilation, which was provided for by building the tunnel with three arched air-passages formed in the solid floor of the tunnel, which was about 10 feet in depth which was about 10 feet in depth. Ventilation was of prime importance because it was proposed to use stam locomotives. Investigation showed that, in those days (1675) the proportion of the control of the c parts, and in the law courts of London, 19 to 20 parts, and in a first-classe carriage on the underground railway 22.5 parts, per 10,000. With 48 trains such 24 hours drawn by steam locomotives, it was estimated that the carbonic soid gas at each quater-length of the tunnel would be 12% parts per 10,000 in excess of the normal quantity of 314 parts

## Proposals to Bridge the Cha

Of the various bridges proposed, note should be made of the Boulet suspension bridge, which was to be carried upon 29 cast-iron piers extendings 480 fact above sea level.

THE VERDER MFG. CO.

lever carried upon two piers 1,500 feet apart, and a series of suppended spans 376 feet in length carried by the cambian and the series of the built by the causeon method. To caseon 100 feet 1250 feet plans, were to be towed out and sunk through the overlying mud to firm bottom. He total length of the bridge was to be 24½ miles with 118 piers and two obtinence piers. Provision was main for two railroad tracks and the total wught of steel in the wholebridge would have been 771 205 tons. The estimated cost in 185 was \$170 0.00 and the total cost in 185 was \$170 0.00 and the first the series of the series of the series of the destruction of the cost to the destruction to far her to \$400.000 000. Not merely the cost but the destructionty of a bridge renders that type of crossing out of the cusestion.

#### The Present Plan

The strata at the Channel consust commencing at the bottom of Goult and upper green sand the lower chalk followed by the middle chalk and the upper chalk. Th tunnel will be driven through the grat chalk which is found at a depth of 89 feet at Dover and 80 feet at Sangasto The material is compact and impervious water it contains no finite and as a substantial commenced by the substantial contains an official standard and the substantial contains and so that the substantial contains and so that the substantial contains and so that the substantial contains a substantial

#### Drainage

The drainage system will consist of separate tunnels which will tap the main tunnel at the lowest level, and diverging from the line of the tunnel they will de second on a slope of 1 in 250 to drainage shafe located on earl level to drain they also will be lined with cost-tron. By the use of boring machines it is expected to make a spood of 17 yards per day for sur days of the week. The ventilation will be by way of a conduit at the top of the tunnels. Air will be blown in by high-speed fans in the direction of the traffic. The estimated cost today is about \$100 000 000 which will be shared equally by the British shared could be shared equally by the British.

There is no question but that the tunnel will now be built 1 he former British fear of invasion never well founded, has dasappeared in the prosince of the close alliance of the past five years and the demonstrated value of the tunnel in the event of future joint hostilities of France and Great Britain against the common enemy Probably construction will await the return of more normal conditions in the industrial world, but we look for the completion of this great work within a

## Our Stockholders

There are over 135,000 stock holders who own the American Telephone and Telegraph Company This great body of people, larger than the entire population of such cities as Albany, Dayton or Tacoma, share the earnings produced by the Bell System

More than 45,000 of these partners are workers in the telephone organization They are linemen, switch board operators, clerks, mechanics, electricians

The vast property of the Bell System represents the savings of these thousands of people, in many cases all their savings

In the truest sense of the word this big public service corporation belongs to the people The people own it and the people receive the profits. More than 93% of its stock is owned by persons holding, each, less than one-ninth of one per cent

The Bell System is a real industrial democracy On its economic operation depends the future independence of many citizens of small means, as well as the profitable employment of thousands of other men and women

## Aertal Greyhounds of Tomorrow

(C'minued from page 401)

sumfur mooring tower for several weeks at a time with winds blowing up t 50 and more miles an hour, without

sustaining the slightest damage.

The disjoint service will be no fair with ler proposition so we are assured the elements of weather that bave influence on airship travel are wind rain had snow and fog. It is not licely that much certainment travel are wind rain had some and fog. It is not been the fact bull snow and fog will of themselves have much influence on analop flang. With auntable run proof non-absorbent after covering the absorption of water 11 I the consequent increase of weight are 15 ide.) Hail and show will not adhere t the huge hull when in flight owing to the high speed through the air and in any case as the precipitation that is not usually more than 8 000 feet, where can be entirely avoided by flying above this height 10 cm might give trouble in landing, but in flight the airship would be above. the fog and not be affected by it. In han hing suitable means would be taken to

back on as already suggested

The only important factor that need be taken into consideration is wind, but in most cases unduly strong winds can be avoided by flying at a higher level or staling avoint of by hying at a rigitor two or saming on a different tourse so as to avoid the storm are As is well known, there are it see level between certain clearly-defined latitudes provailing winds of con-stant direction of which advantage may be taken by, smitably laying out the course and route to be followed. Again at the higher levels, there is at most latitudes a constant drift of which advantage may be taken if the winds at sea level are unfavorable At any rate the matter of wind is not a serious one when the navigator has so broad a medium in which to sail

#### Sky Pilots for the Sky Lin

The mivigation of surships is similar in principle to that of steamships but is made more difficult by much greater drift to be allowed for the actual course of a be allowed for the actual course of a ship being the resultant of its own forward apord and that of the motion of the air in which it is 1 orie it is impossible for the manginer to plot his true course relative to the irrh unless he is aware of the in turn of the air. When navigating over hand be sable to the termine the drift. of his ship by observation of a suitable fixed point on the earth's surface, and adjust his compass course accordingly to give the desired true course. Over sea, of course no fixed point is available, so if the motion of the wind is not known, the course unust be periodically corrected by astronomical observation and discrimination of his charted position

A reliable and effective included of navi-gitim is however, available with the wire-less installation. If the ship is in communi-cation with two stations they can deter mine the direction of the transmitted waves and signal back the ship s bearings undustice have believed to replace it.

If pure if the Boshevite is the man without plot Be strang to the start and the new departure determined. It is known that this include strength is the start in the first and the new departure determined. It is known that this include strength is the start of direction was used successfully by series if talk if it has any bearing too and butter ground of the total way. The strength is the four years of war but more like it is the start of the

of the voluminous documents and drawings of the British engineers, it is obvious that acrual transport is close at hand lech muslly seronautical men are prepared to open airship routes to-morrow financially, there is some question. The engineer has gone ahead and done silt the planning, the constructors stand ready to execute the plans stready in hand but the capital for such a project is still to come And it will come for the airship must soon develop into a rapid means of travel between distant cities and countries and continents

#### New Industrial Uses for X-Rays

I N an address delivered before the Bir-mingham and Midland Scientific Society, British, on February 19th, Major Hall-I dwards stated that radiography was capable of much wider application to industry than was generally supposed to be the case He mentioned that X-rays had already bech used in connection with showed some radiographs of sero engines which plainly revealed defects in the internal structure of the castings. Car reigns had also been subjected to exami-nation by means of X-rays, with the result that inequalities in the disposition of the metal sufficient seriously to affect lan lun, suitalvie means would be taken to jod the metal sufficient seriously to affect mark the landing place by means of raptive the trajectories of the projections, had been balloons or kites, and strong searchighted discovered. Wood for surplance had been could be used on the ground Rain, hail sure want for are also generally local in gasted that the investigation by means their occurrence, and could in any case of radiography of conditions of strains, generally be avoided by a short deviation compression and bending would yield a reform toute Cross-Atlantic records in jointstion of much importance.

## Why does Swift & Company handle poultry, butter, and eggs?

For the identical reason that your retail dealer handles them.

He has the ice box necessary to keep meat fresh and equally necessary to preserve poultry, but ter, and eggs.

And he can reduce his expenses for rent, salesmen, and delivery service, by selling more goods

And he can serve you - because you often like to buy poultry eggs, butter, and cheese when

and where you buy your meats It would be inexcusably wasteful if he did not do this.

Just so with Swift & Company The retail dealer finds it a convenience to buy other goods be-

sides meat from us

We have the equipment - refrigerator cars and refrigerated branch houses built to keep mest fresh and just as necessary to preserve poultry, butter, and eggs.

And we have the distributing organization—branch supply houses salesmen and delivery equipment taking our goods to the retailer a store

It would be an inexcusable economic waste to use this nationwide distributing organization for nothing but meats.

Our entire selling cost is kept down by volume of business, made larger by handling poultry, butter and eggs.

Swift & Company furnishes the most direct marketing route from the farm to the retail dealer

INTERNATIONAL MOTOR COMPANY NEW YORK

# Tarvia stands the traffic test—

THE photograph below shows the vanguard of a fleet of 32 U. S. Army trucks bound from Detroit to the Atlantic seaboard.

For many months, several of these long fleets of heavy Army motor-trucks passed over this East Broadway Road (near Toledo) every day, in addition to the very heavy local traffic of this busy industrial center.

Yet the road, which was constructed with Tarvia several years ago, is still in excellent condition.

## Tarvia Solves Perplexing Road Problems

Your community can have good serviceable, economical roads like this one if you will adopt Tarvia.

Not only does Tarvia make a macadam road water-

proof, frost-proof, dustless and mudless, but it reenforces the road-surface so that it is strong enough to withstand the grinding, prying, crunching driving-wheels of giant motor trucks.

There is a grade of Tarvia to fit every road condition. On new macadam construction "Tarvia-X" should be used as a binder. Existing roads should be surface-treated with "Tarvia-A" or "B." Patching should be done with "Tarvia-KP".

# Special Service Department In order to bring the facts before taxpayers as well as road authorities, The Barrett Company has organized

a Special Service Department which keeps up to the

minute on all road problems. If you will write to the nearest office regarding road conditions or problems in your vicinity the matter will have the prompt attention of experienced engineers. This service is free for This picture is greatly the asking. Booklet on request. onlarged from a small mapshot taken near Toledo, Ohio, on the East Broadway Road, while America was in the midst of war activities. The road has been a Tarvia Road for years.

# PROGRESS!

— Better Workmen-Better Work-Better World

THIS trade mark pledges to a Tchests of L V Estes In orporated an industrial engineering service consistent with the Estes reputation for I adentify and record of results THE line of all progress is through human progress. In any productive organization aiming at greater output, less waste, lower costs and higher quality, betterment starts with better workmen

So do not number your organization by hands Count the heads—and the hearts Train the heads Win the hearts The hands will then be capably and faithfully used in your service

Such progress marks those concerns which have employed Estes Service L V Estes, Incorporated, is an organization of skilled engineers who are also practical working men Estes methods attempt no unnatural stimulation to unusual production Men are never mistaken for machines

Estes service will develop for you workers who are willing to work, individuals who are ambitious to succeed, employees who are better, happier, more contented citizens

Information for executives. A 24 page book "Higher Efficiency" tells more about this service It is free to executives. Request it on your letterhead today No obligation mouried

#### Jellicoe on the Grand Fleet

STIDOM if ever has the commander method of maxil or multirey forter given to the public so candid and illuminating a store of his war ever considerable and the following every construction of the start of the star

The work has been spoken of as an apologia written for the express purpose of defending the author against criticisins of his strategy and particularly of his tactics in the famous battle of Jutland but we are free to confess that a careful reading of the book has left no such impression upon our mind. Rather we carry away the impression of a straightforward story told with characteristic sailorman frankiess of the day by-day experience of the fleet is viewed from the position of its commander in thicf Had the Admiral been writing a private deary of the war he could scarcely have been more flank in his statements of defects in strategy that had evidently been imposed upon him from without or in his revelation of the unpreparedness both of the Grand Fleet and of its naval bases in the North sea for the stupendous task with which it was so suddenly confronted

And reading between the lines those of as who follow the course of naval affairs in the United States are able to place the blame for unpreparedness where it belongs it was not the fault of the Jellicese the Percy Nectis and the Beattwe of the British navy that the Grand Fleet, short of destroyers short of submannes short of secutcrusers, short of up-to-date range finders and searchlights, was ordered to Sups I how an utterly unprotected base upon to distroyer and submanne attack—no more afther fault than it was the fault of our own Dewevs and Simees and backes that our batth-ship fleet was less than one half of its proper not mechanism for the containment of the proper and the short of the containment of the proper and the short of the containment of the proper and the short of the containment of the proper and the short of the containment of the proper and the short of secuts and destroyers and had no bettle crusiers whosever

So long as navel appropriations are mode the sport of the politerians a great navel power list the United States or terrat Britain will be continually faced with the possibility of diseasest. And see long see a political list Chirchild can force in Craud I better do its cooling in air epen and undefended harbor opening onto submanimentated water or bring strong pressure upon that flert (an Churchill actually did) to engage in such a mad venture as a bombordinent of the Hispoidand forts the norsh even of the high command will be disturbed and their sortness of themselves and their strates of the more strong.

It is unaring to harm how alight was the superiority in capital shape and how deried the inferrent's in distroyers and light remees of the British to the Germans in the North's Ne during the early months of the war. Being the blockaded fleet the Germans could cleet to come out when every whip of the High-Weak Fleet was in perfect shaps. The British due to continual cruming in one of the stormiest of sons always had

some shaps undergoing refit or require Thus, Admiral Idlicoc tells us that towards it closs of October the Grand I ket was considerably weak and spart from the fact that it had lost the Addacions The Ajax had diviloped condensar defects Iron Duke similar troubles the Origin' had to be sent to Greenock for examination of the turbine supports which appeared be noted are dreadmonght battlesings) was at Devon port refitting and the "New Zealand was in dock at Cromatty the 1rm and Agmourt having been movely commissioned, could not yet be regarded as efficient so that the drundmought fleet consisted only of 17 effective battleships and feed the cruisers. The Cerman drendmought fleet at the tone comprised 15 battleships and four battle-ormsers with the Blucher in I veryone will agree with the Admiral when he savs The markin of superiority was therefore unpleas antly small in view of the fact that the High Seas Ficet possessed 88 destroyers and the Grand Hect only 42

Admiral lethics says that he often wondered why the curmons did not make greater efforts to richer the British strength in capital shape by destroyer or sub-matrix attacks on the British has a during those early those early like possessed. In many in comparison with the uses to which they were required almost super-fluid to destroyers certainly a super-fluid vaccing and the could not have put them to in better use than main attack on 8 ups 1 low during the early months of the 1014-1015 whiter.

Speaking of the frequently-made suggestion that the formal Fleet should make an attack upon the ligh Scas Fleet at anchorm it home port he saws. They not only possosed the most powerful and imple artifler defences that we know also that the Germans had a very efficient uning service, and we were justified in assuming that they had protected their naval bases by extensive name helds. We on the other hand were cutricly unprovided with this party olds form of defence.

laken altogether it is evident that the Germans mosed their great opportunity at this very time. How they failed to know of conditions at Seapa Flow is puraling to eas the least. The Zeipa line should have provided this knowledge. The Admirals seen suggestion is that it may have seemed impossible to the German and that we should place our flost. upon which the Empire depended for its very custome in a position where it was open to authorize or a position. Because between the lines it is very violent that Admiral Selfices and his staff were not responsible for the selection of Stapa How as the naval base in those perilous days.

#### The Revival of Amateur Wireless

HESE are glorously bus days for a certain class of Young America familiarly known as the wire-less amateur. In the attice or basenent, city bedroom or backyard shed, he may be found in his spare moments hard at work getting his station in order. The accumulated dust is being wiped off tuning coils, telephotic receiver and variable condensers and the various components are being feverably assembled and wired to receive the writens signals. And in many instances three is a sinse of restless expectancy not unlike that which comes upon one watting for the curtain to rate for the decision at a play for this fact is that much has but done in wireless withgraphy and telephony during the past two years and their are many new and strange signals ready to greet the amateur.

It was the recent riskstment of Acting Secretary Rossewth of the Navy, to the effect that all restrictions on receiving windess stations were raised as from April 15th last that revived amottive wireless. Five since the war the aimst urs had been previoted from transmitting and receiving and while many are disappointed that and revering and while many are disappointed that the thing of the receiving restrictions have been removed, all dark the Navy has at least made a start the thing of the second of

Amateur wireless is to be more firmly established than ever before. Having been successful in warding off proposed laws unended to stife amateur wireless from time to time in the past, the young and old Americans engaged in this most remarkable of all hobbies are in a better postion than ever to mantain themselves Surely.

it would be an ungrateful government that would again challenge them after their remarkable record in our war afforts.

Aside from having supplied some ten thousand radio operators, who stepped into the Army and Navy practically ready to be put to work, the wireless am of this country supplied our Government with leading radio engineers Major Edwin Howard Armstrong for mstance, has been a New York amateur, and Press dent of the Radio Club of America. During the war, he has been in charge of the Radio Research Section of the U S Signal ( orps in France He is the inventor of the well-known regenerative vacuum tube circuits, which greatly helped to solve Navy radio communication problems. He helped to perfect the radio receiving sets for airplane use, thus permitting instructions to be received instantly ins ead of by means of cloth strips on the ground as formerly. He designed a very efficient multi-stage amplifier for use in simplifying the weak currents in small receiving loops, and so on He has been an assistant to Prof M l Pupin of Columbia University and the winner of the gold medal of the Institute of Radio Engineers for the best radio invention

Then there is I Johnson, Jr Director of the Radio Chib of America in peace times and I vpert Radio Aide U.S. Navv. in charge of technical division of the Naval Aircraft Section, during war He was the organiser of the foregoing-mentioned division which, within a few months, had in operation radio telephone sets on board most Naval scaplance which greatly helped to patrol our coast during the U-boot scare Lieut H salenwater U S N radio officer in charge of the radio technical work on Navy NC planes that will start across the Atlantic, also a Director of the Radio Club, Ensign Frank King, U & Navy, radio officer in charge of Radio Laboratory for Aircraft Radio at Norfolk, Va, and later radio officer in charge of Navy aircraft radio work in I rance who is a past president of the Radio Club of America Ensign George Fitz U S Navy, radio officer in charge of Radio Laboratory for Aircraft Radio at Norfolk, and later in charge of radio work in Englandthese and many more, are old-time wireless amateurs whose hours upon hours of experimentation and tinkering were capitalised to the end of helping the United States

So that can be no doubt that the wrieless anataur has proved his right to existence. He reduters into his hobby with a broader knowledge of wireless in particular and electricity in general. Wireless communication is more mysteraust than even and pruniness for more in the future than was ever believed possible. Long live the wireless amateur!

#### Popularizing American Aviation

AVIATION is a thing which requires constant advertising if it is to survive. Before the world war, England, France and Germany kept up public interest in airplanes by aviation meets, huge prices, and spectacular feats. In marked contrast, little was done in America, and as a natural result the public cared little about airplanes. When we outered the war our aeronautical equipment was conspicuous by its smallness and general backwardness.

In order that we may not lose our splended position in the seronsutical world, which we have gained through almost two years of intensive war efforts, it is to be hoped that airplanes and airships will be kept before our people In this connection the coming Second Pan-American Aeronautic Convention and Exhibition is a hopeful sign of our future aeronautical policy This gigantic under taking will be held from May 1st to June 1st, 1919, inclusive, at Atlantic City, N J, under the auspices of The Aero Club of America, The Aerial League of Amerand the Pan-American Acronautical Federation Exhibitions of the latest types of lighter- and heavierthan-air machines, the reading of technical papers by the leading men in the seronautical industry, motion pictures and lantern slides, races and contests of all orts for all classes of machines, parachute contests, intercollegiate contests, avisite (bieyeles and motor eveles with wings) contests -all these things are feature of the remarkable program for the month of May, 1919, at Atlantic City, N J The governments and seronautic. sporting, scientific, industrial and civic organisations of the United States and all the countries of the world excepting Germany and her allies, are invited to sent representatives to attend this great aeronautic event.

## SCIENTÍFIC AMERICAN

#### Naval and Military

Training for American Merchant Marine.—The United States Shipping Board recently announced that since the establishment of its squadron of merchant marne truning skips in January 1918 up to the first of April of this year, 22,523 American an utissue were accepted for training to the ships as apprenticed salars, foremend stewards. The course of training is two months and the Board announces that it now wants 2000 mar young men for the training as apprentices

Zeppelins as Naval Scouts —The German idenometrated during the war the supreme value of Zeppelins for naval souting Adminal Sims in urging the construction of these arehips refers to the trip of a Cerman Ampholin Blaigaria with supplies for the German force in Last Africa. When she had proceeded beyond Khartoum, she was recalled by radio because of the surrender of the Cerman forces. But covered 4:300 mills without a step and was solf for 108 hourself.

To Organize a Trench Mortar Regiment — Ibwattime organization of trench mortar batterns with the divisions is to be abandoned in favor of a single trench mortar regiment, which will be organized as a part of the arroy artiller; to be useque do for duty by the sermy commander Trench guns resulted from stabilized trench warfare and the divisional batteries but their usefulness excepting under special conditions when the Allied attack turned the warfar into an open struggle For that reason, the trench mortar units of all divisions were among the first to be sent home

Port Facilities in the United States — the United Rates Shipping Board has drawn up a last of ports and harbors of the United States which are capable at meas low water or mean high water of a commoditing vessels of 5,800 gross tons, with a maximum draft of 24 feet. They are lasted in three classes with 2 in Class A, 10 in Class B, 20 in Class C, and 5 in Class D, the prote capable of accommoditing ships drawing a feet. Nature has been bountful in providing our 1,1000 miles of coastline with deep landlicked bays and broad estimates which offer sele harbor to ships of all broad statements.

Artillery in the Late War.—In his final dispatch, Field Marshal Sir Douglas Hug gives some straining figures showing the growth of inclinative In 1914 the British had one machine guit to 500 infinitymen in 1918 they had one machine guit to 30 infinitymen, and their artillery rose from 486 guins at the outbreak of the war to 5,437 at the signing of the armstitle On the British of the Somme battle in 1918, 13 000 tons of armiunition were fired by the British, in 1917 on September 20th and 21st, 42,000 tons were expended and in the three days when the British broke down the Hinda dung ine September 27th to 28th 1918 nearly 05,000 tons of shells were fired by their artillery.

Men. Versus. Ships.—An outstanding lesson of believes a story of the Grand bleet is that it is men not material, that win battles. The supposed great superscript of the British fleet over the Germans in the North-Sea simply did not exist, at least in the earlier stages of the war, when the German High Seas Fleet Consisted of 15 battleships and four battle-crussers, and the British Grand Fleet of 17 battleships and five battle-crussers. The British access in battleships was offset by the fact. That Germany had between 90 and 90 deservoirs to Great British at 15 these fagures apply only to the North-Sea, where the total German strongth was concentrated and where a part only of the British fleet was present.

Last Year's Shipbuilding Output.—Outside of Germany and Austra-Bungary, the shippards of the whole world during 1918 produced 5,477,444 gross tons of merchant shippung, as given in the Annual Summany of Lloyd's Repeter of Shipping. Into its 70 per cent higher than the total in the year 1913 which held the record for construction and included the output of Germany, Austria, etc. The total for the United Kingdown in 1918 was 1,348,120 gross tons and the output for the United Risates was 3,03,030 gross tons, which is equal to that for the ten years 1907 to 1916 in the United States, and half of this was built on the Pudific Coast. Of the United States total custout of 5,025,260 tons, about 1,000,000 consisted of wooden

#### Science

An Ornithological-%obbery — Dr. W. J. Holland director of the 4 arangil-Wilmann amounces that a shipment of birds collected for the museum by S. M. blages ment of birds collected for the museum by S. A Service of Eugenic Advice — The Digenies Record Office at Cold Spring Harbin Long Island reports that it carries on a rapidly not asing amount of correspond once in response to requests for advice concerning the congenial times of proposed incarranges. Most enquiries grow out of two situations viz. (1) cantic nighteel cours manings and C20 the marriage of persons in one or both of whose families there is a nitropathic taint. Persons making requests for advice along their lines are always required to prepare family-history data according to instructions given by the Office. I ingenies advice is then given in accordance with existing knowledge of the inheritance of traits.

New Sources of Rubber in the United States -On behalf of the Carnege Institution of Washington an extensive survey of the Great Basin region for rubberproducing plants was begun in the year 1917 as a waremergency project During 1915 this broadened into rehensive search throughout the western United States for species known or suspected to contain rubber and the work will be continued until the rubber-producing possibilities of the native plants at least have been fully investigated A chemical laboratory has been installed for the grinding and extraction of the plant material In addition to species of Chrysothamnus and Ericameria, the first genera studied 18 genera and 30 species have been examined chemically and in four of these the perentage of rubber was high enough to warrant the hope that the species may serve us a commercial source of

Weather Bureau Begins Work in Volcanology -Under authorisation of the current appropriation act for the Department of Agriculture which provides \$10 000 for investigations in volcanology the U S Weather Bureau on February 15th 1919 formally took charge of the volcanological observatory on Lilaues Hawanan Islands Prof 1 \ Jaggar Jr formerly of the Massachusetts Institute of Technology who has been director of the observatory since its foundation will remain in charge. The investigations at Kilanea were begun in 1912 under the auspices of the Massachusetts Institute of Lochnology, and since 1913 have been many tained at the expense of the Hawanau Volcano Research Association consisting chiefly of residents of Honolulu It is expected that the Weather Bure on a work in volcanology will be developed in many details and eventually he extended to Alaska and other regions under the control of the United States in which active vol-

The International Catalog of Scientific Literature - This important scientific bibliography is normally published in 17 volumes per annum each volume bring devoted to a separate branch of sounce. The last annual report of the United States bureau of this undertaking situated at the Smithsonian Institution, calls attents in to some of the difficulties that have arisen in consequence of the war. Six of the regional bureaus, viz. ( Austria, Hungary Poland Belgium and Russia are in arrears with their contributions to the extent c warh \$9 000 per annum, and it will be necessary bt un a subsidy from some sour e to finance the annual issue of the catalog as was done in cornection with the fourteenth issue for which grants were cotained from the Royal Society of I orden and the Carnegie Loundation of New York It is especially interesting to learn that the work of and ving the literature published in the countries whose regional bureaus have closed has been carried on largely by the central bureau, in London where already 15 000 reference cards have been prepared for the German literature of 1915 The central bureau could continue to index (serman literature, in case Germany is excluded from cooperation in the enterprise in years to come It has been proposed to broaden the scope of the catalog by including the literature of various technical industries, instead of limiting the work to nurs whienes

#### Electricity

Improved Lightning Discharges -According t the Reine Generale de l'Electri de la French patent has been taken out for a new form of lightning discharger of the vacuum type. The new principle consists it using a radioactive soft (radium chloride is suggested to furnish the necessary iers in the tube to produce an instantaneous discharge across the gap in this way it is claimed the time lag between the application of the excess voltage and the dis hoge is muterially bissened Resumption of Amateur Wireless - All restroits ms upon the use of radic receiving stations other than these used for commerced truffic were removed on April 15th last. The order which was innounced by Acting Secretary Rosevett of the Navy Department applies to amateur tecinical experimental and other stations The restrictions on fransmitters however remain in effect for the time being

Radium Indicators for Switches and Pull Chagins ——Among the intest novelities in the electrical equipment in the control of the product of the control of th

Peat Excavating by Flectricity—The efficient digging out of past practically increasities some form of excavating machinery and it is interesting to observe that according to the London heterizating, and heterizating clearly driven appliance of this kind has been in use in Holland driven appliance of this kind has been in use in Holland also buckets, into which the past when cut out is deposited. The machine is driven is an electric motor. It is possible to cut 1100 club ayards of peat per day of 10 hours, which is equivalent to about 350 tons of dry post. The machine can be proposed to the machine can be provided forward on rails laid on the surface of the part or when the water-level is near the surface on the dick of a raft.

Electric Precipitation of Particles from Waste Gas - in interesting development in the electric method of depositing solid materials in suspension from waste gases is recarded in the Flectrical World. In a copper refining plant in the east, the Cottrell process of electric precipitation has been applied to remove 90 per cent of solid and liquid particles in suspension in fluc gases and it is estimated that within quite a short negod the amount of copper and gine reclaimed will pay for the equipment | Lie discharge takes place at 100,000 volts and 0.5 ampere and the transformers used have tappings at 50 62 7 and 87 per cent of full voltage Another example of a similar process is given in American Gas France and which summarises the work of Dr. 1. D. Davidson on the treatment of coke-oven gas. In this case deep utt les are precipitated by an electrical method an map right testure being the removal of tar, which has always been a source of trouble

Wireless Equipment of the 'George Washington - The stenmer which has been carrying President Wilson lack and forth between the United States and I more is no doubt the best compared ship aftent as regards radio equipment. Indied it has been referred to as a floating belorid by for wireless experimentation and research. The radio countment on the hist trio with the Presilent consisted of one lew power spark transmitter on 16 300 inster long wave receiving set one short wave 600 meter receiving set for spark signals one short range ridio telephone triasmitting and receiving set one vacuum tube 450 meter transmitting and receiving set. The escorting battleship. Penn sylvania re cived messages transmitted from the high powered stations at Anonpolis New Brunswick and Inckerton in the United States and Lyons Trance intended for the President and relayed them by the vacuum tube, and radio telephone sets simultaneously Messages from the President destined to the United States or France were sent from the George Washing ton to the Pennsylvania by the vacuum tube or radio telephone set and relayed by the battleship s 30-kilowatt are transmitter

get in under the Stars and Stripes but those things only happen in books. Lingland had invested a lot of money in training inc. and I guees she had a right to all I had to give Anyan I was it.

give Mayway, I gave it.

Of course all of as requilar ( > A chaps fult zors as a boil that the ( > 5 didn't get more planes and men into be fulter for the game. I he men were splended regular fellows all of them. All the British flying people think the American arman is a danly. They swear by Ritck, you know We I mean they—think the Liberty motor is all right, shrhough they have a big fallow of their on which is some punkins of a motor. But they haven the much to say about the American plane. I flow thow just how much

of this is some one's fault and how much something that couldn't be helped I we talked with a lot of us Amercans in Uncle Sam's khaki about the trouble with the American plane

American plance worked the D H to just into quantity production Well, it didn a seem to hold up if it smaked it just fairly splintered. There are two answers then see a consistent of the wood, spruce which has been seasoning of the wood, spruce which has been seasoned in a hurry ham't the strength of spruce which is naturally seasoned. The other nawer is that machine production of wooden parts leaves out the human element Imprection doesn teem to reach the

"A workman who fits all his wooden parts by hand, and more especially if he is a seasoned, skilled workman, gets an uneanny ability to tell good wood from bad. The

hidden flaw he detects somehow The mapestor cast, to master how good he as So there were a lot of chaps who were out of luck m Americas D H planes who ought to be flying now—as least, that's the way it seems to the Americas flyers in American uniforms Personally, I am morally sure that if it had been a quantity production plane I dropped ten thousand feet in, just landing on the wing pur wouldn't have saved me I'd be ar feet under with the boys

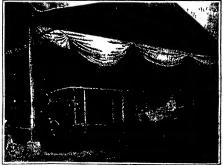

mainting up a headboard for ma Sure I know this sort of thing doesn't get published Heaven knows I'm not knocking any one I like the British lade fine and I've been a member of the family in fact, just aswell as in uniform. They don't say much, but they seen let you know whether you belong or I'm Yankee all through, and don't you forget it, and I'm not getting out any hammers for Uncle Sam But facts are facts and you can't cover 'orn with brush and paint and get away with it. And so when I see a lot of whitewashing done about American participation in not at, but for in country.

the air work over here, it sort of makes me mad, not at, but for my country.

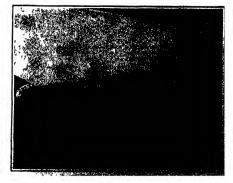

Oh, its natural enough for any one connected with the service to want to make the very best showing he can But—well, I took the trouble to collect a little information as to just what we, U B A that means, had actually done at the front, as to machines and mean

suggested I got my facts from the flying men, no office statutus about tha, and you can call them gospel ryth or German propaganda lies, whichever you choose ben't forget it a Yank in this uniform taking, will you? All right Here's what the U S had at the front.

I suppose you know there were 20 pilots in a squadron! Well, at the armistice the Americans had 12 pursus squadrons. They had one observation group of three squadrons. There was one day-homblag squadron and there we stopped 10 feourse we had night bombers, but they are included in that first twocommunities may be 10 feour may be 10 feour may be 10 feour (Constituted on page 40)

## Small Airplanes and the Trans-Atlantic Flight

### Describing the Sopwith, Short, and Martynside Airplanes Entered in the Great Contest

THE coming trans-Atlantic flight has taken a queer turn. Only yesterday everyone in and out of turn Only yesterday (veryone in and out of aeronautical affairs was expectantly waiting to see a line up of giant planes such as the Handley-Page Capron: Farman Goliath and our large Naval machines Surely no one would attempt the flight with a single engine for has it not long been patent in aeronautical contests that even the best engine is upt to fail at the critical moment? Yet at the moment of writing we are on the eye of one or more attempts with comparatively small two-scater biplanes equipped with

a single engine Truly it

is a great surprise

There has been no dearth
of surmen willing to attempt the great trans-Atlantic of contestants already far exceeds expectations and because of the growing er-tainty that the flight will be achieved in short order the contest is fast developing into a race with the largely in favor of the first one to start. Thus it has come about that while most airmen and constructors have been leasurely going about multi-engined planes with every safeguard against a total failure intrepid British aviatore have stolen a march on practically everyone by getting small, i wo-scater ma

ready to depart at dimost any moment. It may be that these aviators are taking a gambler schance with the possibilities of engine faulure and forced landing it may be that one two or the three of thom will fail in their It may be that attempt, but after giving the entire matter considerable thought it would seem that they stand an excellent chance

thought it would seem that they stand an exercised coarse of auce dup hefore this rest he is the rester.

The three small planes referred to are the Sopwith to be flown by Harry G. Huwker and Lieut-Com. Curev. the Martyando which will be the mount of Predunds Philip Raynham, and the Stlori manual by Majos Wood and Captain Wyllis Thou first two are starting from Newfoundland, while the laster is starting from Ire

The Sonwith msc hine weighs, fully loaded, about 6,100 pounds, and carries 300 gallons of gasoline it is equipped with a Rolls-Roye "Eagle" engine, de-veloping 400 horse-power veloping 400 horse-power. In a recent test before the machine left England, it covered a distance of 900 miles in nine hours and five minutes, 146 gallons of fuel being consumed. This constitutes more than a third statement of the constitutes more than a third statement. stitutes more than a third of the capacity of th or the capacity of the sansa It will be noted from the accompanying illustration that the Sowith biplane is very similar to the American Carties training plane in general design. However, it a far more powerful ma-ine, and considerably awar The fairing of the

Later two other islands were built to the southwest of the first one On Island No 2 are the hospital buildings and on Island No 3 are the wards for putients suffering centor patients sunting centragious disease. The original slind known as Oyster Island was barely four acres in extent 1t now covers 10 acres and will soon be extended to over 15 acres the hasm between Islands No 2 in I No 3 will be filled in and the whole area of Fills Island will then cover more than 28 acres or seven more than 28 ares or seven times the area of the original island. The extension is shown in the upper right-hand counce of the title page.

a boat
illustration
Between the main island and Island No 2 there is a ferry basin enclosed by a seawill which originally was built on crib work. Every year this waterway has to be dredged out to get rid of accumulations of sediment, and this constant dredging has had the effect of motors mining the crib work so that the walks bordering the seawalls recently began to sug and break away with the probability that before long the whole wall would topple over into the water. To remedy this condition, it was decided to build new scawalls of concrete reaching down to such a depth that they could not possibly be under-

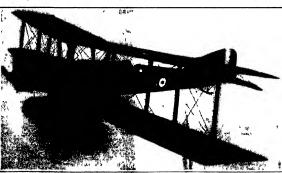

mused by dredging. The work on these walls us now proceeding

The new walls are built of luge concrete blocks just outside the crib work walls outside the crip work wais.

First a trench is dredged in
which are lad bags of concrete. These on hardening
form a good foundation for
the wall. In order to furnish
the concrete blocks with a level bed to rest on railroad rails are placed at either side of the bag work foundstion and the space between them is filled with concrete deposited by means of bottom dumping backets Before placing the concrete, divers caulk up any openings between the rails and the between the rails and bag work by means of long narrow bags filled with conrete. The concrete fill as divers who lay a rait across the marginal rule and slide it along the foundation. In the way the concrete releveled off

very meely. Whenever the surface for a bucket of concrete to till the cavity

After the floor has set the concrete blocks are laid These are huge masses of concrete, 17 feet high and 12 feet wide measuring nine feet thick at the bottom and five feet two inches at the top. They weigh about 87 tons apiece. The process of lowering them into position and adjusting them properly on the from into position and adjusting them property on the foundation is no simple one. In order to handle the blocks, chain grooves are formed in them and when the chains are removed slots 12 inches in disjuster are (Continued n page 44t)

#### Composition of the Atmosphere of the Soil

FROM 10 to 20 per cent by volume of the soil is composed of air, but this "atmosphere of the soil" differs from the superficial

atmosphere in composition able The percentages of its constituents vary likewise from season to season Recent investigations of this subject by two English scientists. Messrs Russel and Appleyard at Rothamstead in England furnish some interesting data To a depth of of one of the soil atmosphere is very smiller to that of ordinary air, though containing a little more carbon dioxide, but the total amount of carbon dioxide plus oxygen is less than in the air During periods of active

coryen, the than in the most burning to the depth of the precision of original distances and this is one of the conditions which characterises the so-called "awakening" of the earth in spring. Besides the atmosphere entangled in the intersities of the soil there is a certain amount of air dissolved in the water and the colloids the soil contains, but this is the water and the colloids the soil contains, but this is the water and the colloids the soil contains, but this is the water and the colloids the soil contains, but this is the water and the colloids the soil contains with the property of the soil increases with the water and the colloid the soil increases with the water number of the soil increases with the suptaintosphere is renewed by the rain. This fact indicates that rain is supernot to irrigation. As might be actions the soil increases which was the soil increases that the soil increases with the water and the soil increases that the principle of the soil increases that the soil increases with the soil increases with the soil increases with the soil increases that the soil increases with the water and the soil increases the soil increases that the soil increases the soil increases that the soil increases the soil increases the soil increases that the soil increases the soil

## Supplying the British Farmer with the Sinews of War

How Inadequate Supplies of Labor, Machinery, Seed and Fertilizer Were Stretched into Sufficiency

By Major H. Bannerman-Phillips

THE problems of administrative organisation of the messis for increased food production, and of a sufficient land supply for the carrying out of the program, have been designed in a previous article, in which it was shown low they have been solved. After this, the main contract have been to secure an adequate supply of labor, cerus nave been to secture an acquire supply of lator; to lanreace and properly mobilise the supply of horses and agricultural machinery, and to obtain and distribute a sufficiency of seed and fertiliser. In July, 1914, it was estimated that in Great Britain the number of men regularly employed in agriculture

was 800,000, while the number of women was 80,000, and that, in addition, 120,000 men and 50,000 women were employed at casual agricultural labor Hy January, 1917, the number of men had fallen to 562,000, and as 1917, the number of men had fallen to 062,000, and as there then remained in agriculture 177,000 mes of military age and 118,000 under 18 years old, it appeared that additional large numbers would have to be lost Further inquiry had hrought out the fact that the system of voluntary recruiting on the one hand, and the action of losal tribunals on the other, had resulted in an action of local tribunals on the other, had resulted in an unequal distribution of farm labor for far as was possi-ble, efforts were made to rectify this inequality by limiting the demands of the War Office to particular areas Owing, however, to the urgancy of reserving labor for carrying out the extended tillage program, it was finally decaded in June, 1917, that no agricultural labor might be recruited in Great Britain by the War Office except with the consent of the Agricultural Executive Committees in England and Wales or of the Board country Committees in England and water or of the Board of Agriculture for Southand Meanwhile, the War Office had taken stops to assist the Boards of Agriculture in England and Soutland by placing at the disposal of the Executive Committees a considerable number of skilled Fixecutive Committees a considerable number of skilled plowmen and a still larger number of unskilled workers in the spring of 1917, 21,000 plowmen and 19,000 other laborers were lent for agricultural work in England and Wales The bulk of the skilled plowmen were lent only

for eight weeks, but the seesstance proved invaluable in carrying out the sping tillage. In Seviland also 1870 men were loaned flow the aims to assut in the spring cultivation. During the year, also, the War Office provided labor to new-t at the hay an I corn harvests and close on 40,000 m n have been made available in Fingland and Wales and 1,000 m to folland. The War Cabmiet also desided at the end of June that preusion should be made during the summer for the rele for agricultural operations during the scason of 1917 18 25,000 men experienced in agricultur or used to horses and 25,000 unsalled meis. Up to the middle of December about 35,000 men had been made available

In addition to the supply of military labor special efforts were inade to securathely of women as workers on the land An active recruiting campaign was undertaken and provision was made for truining workers by means of short courses at colleges, institutes and on the farios Complete returns of the number f women completed in ulture are not available but it is estimated that 270.000 women are now employed as permanent or anyone women are now imploved as permanent or temporary farm bands. This capanison is largely due to the work of the voluntary organization of the Women a War Agranultural Committees village. Registrars and District representatives, and have been greatly helped by the appointment of group leaders with technical knowledge who have organized gangs of part time village workers all over England Women have proved in farm work, as in munitions and in many other occupalarin work, as in multitions and in many other occupa-tions, how great is the service they can rinder to their country in war time. Squads, also of boy labor from public and secondary schools of the country were organ-ized in vacation and have contributed to the successful results of last summer. In addition to these supplies of home labor, 4,500 German preseners have been em-ployed in competion, with accurate the supplies of the supplies

ployed in connection with agricultural work.

The second requirement for the program of increased tillage was the provision of additional mechanical power.

for the service of agriculture is well as an increase in the number of horses Steps were promptly taken to mobilize the existing supply if tractors and steam plows and to provide for an in reused supply at the carliest possible date. This task was the more deficult because, on the one hand almost all the agricultural implement on the one mand infinest at a agricultural implements makers had been engaged on the minofacture of munitors while on the other hand the importing capacity from America was limited. The suitability of different types of trustors was carefully tooked and finally it was decided to concentrate the main effort on the American machine the specifications for which were generously placed by Mr. Henry Ford of Detroit at the disposal of the Butish Covernment—It had been intended originally to manufacture these tractors in the United Kingdom, but it was found more speedy delivery would result if they were made in and shipped from the United States Dehvery commenced on January 1918 on a program calling for 1000 machines in four months, and orders given for other makes insured that 7 000 Government tractors of one type or mother with plows and other tractor implements would be available to assist in work

for the 1918 harvest in Great Britain and Ireland Another important factor is the use of steam plowing sackit Owner important nature of ishor and lack of repairing facilities, the steam plowing facilities the beginning of 1017 was not bring used nearly as effectively as it should have been flowed difficulties were largely overcome by the release from the army of men experienced in steam tackle work and by arrangements for repairs so that at present all the sets of tackle in this country are being put to effective use. By the beginning of October, 1917 the efficiency of the steam oeginning of October, 1917 the efficiency of the stram plowing plant, so measired by work done, had increased by 65 per cust over what it had been in the period of spring tillage Arrangements had also been made through the Ministry of Munitions for as many new sets

#### Dynamite and Fertilizing

To the Editor of the SCIENTIFIC AMERICAN

An articleappearing in your wave of February 8th under the head of "Dynamiting Devastated Orchards in France," etc. has attracted my attention because a French Horticultural authority has laid before the French French Horticultural authority has last before the French Academy a paper making oldsum that dynamic year an important factor in saiding the fortility of orchard soils, "due parity to the fiscursation of the soil, and parity to the impregnation of the soil with nitrogenous subjects," He makes mention of the fact that the dynamic is to be used "in conjunction with a suitable amount of tenji-ser in a container surrounding the explosive fit sign), a way that the force of the explosion would drive size of the force of the explosion would drive size of the force of the explosion would drive size of the force of the explosion would drive size of the force of the explosion would drive size of the force of the explosion would be supported as and suffur, makes it unnecessary to go any tubble it adding the fertilization by blasting, than to just use six

dynamite alone
In the use of any supplemental fertiliser surrounding a dynamite charge, there is an effect that the advocates of that method seem to lose view of, dynamite in detonation that method seem to here view of, dynamite in detonation and method seem to here, and though the force action and ment instantaneous the heat is a quick, the fertilines currounding the dynamite obstage in the soil is partially burned, and its benefit than must occur from its change to the soil in partially burned, and its benefit than must occur from its change to sel, and is spacelly the same method that the dynamite slone produces plus the mechanical action of widely opening the soil for the gases that follow? The first use of dynamites in adding the serifity of the soil is on, report as having been made in Austria. The grown of fights decidency and citrus fruits on the Peanfo Sispin and Coast have finded use of dynamite in the Peanfo cimary years, and where soil confidence see such that a benefit can be realised, that benefit is wonderfully mani-

fest in the growth of the tree and the quality of the fruit thereof. This knowledge is not so in wa thing, when it is remembered that its fifts, record of use bears the date of 1870, or theresbout. That it has not been widely adopted in due to the fact that in some cases it has been improperly used, and the benefits even go further than another a state to the case as a second of the collection. giving a return to a young or new orchard, it will revive old trees where the work is properly done, in a manner

It is to be borne in mind that the greatest benefit

It is to be borne in mind that the greatest benefit realized from blasted orphard suits follows where the blasting is done at the very driest period of the year "fineutiation is then the greatest thus fitting the soil for the widest possible benefits from the blasting. The question arises, "flow does the dynamite become a fertilizer?" Something over 70 per cent of nearly all high explosives is nitrate and suffur. When these are changed from solds to a gas, through explosion in the soil. changed from some to a gas, among the fissures made, the gas given off passing out through the fissures made, produce an oxidation that has an affinity for the free nitrogen of the air, and the blasted soil acquires thereby nitrogen of the air, and the biasted soil arcquires thereny from the atmosphere a larger portion of that swent tons of free nitrogen, said to overhe overy square yard of the earth's surface, therefore, the soil is enriched. It has been the observation of the writer that the effects of peen the observation of the writer that the effects of blasting are vaible for a number of years, in butter growth of the tree, and a higher quality of fruit. The blasts give best result when placed at a depth of 48 inches to 54 inches

Seattle, Wash

#### The Fertilizer Cartridge

To the Editor of the SCIENTIFIC AMERICAN
In the issue of February 8th, the writer noted with
much interest the description of an idea much the same much interest the description of an dea much the same as one employed by me, in a cartridge containing forti-isers and dynamic The ultimate am of this cartridge is for soil cardinates, medication and involvablesh, and is for soil cardinates, inside a containing the car-necte, by analysis, I have but taken advantage of a stitutifien always set, the separate use of dynamic and the very subcossful usel of fertilisers on the surface This makes as tempolyfales and direct way of feeding, or the treating of trees for their ills through the devolution Medical One.

Medford, Ore.

#### A Great Piece of Executive Work

To the Editor of the SCHATTER AMARICAN I was interested in reading an article in a recent issue of SCIENTIFIC AMERICAN on Edgewood Arsenal, Mary

We are interested in this article because of the fact We are interested in our article locause of the construction and operation of the chlorine plant which was built at Edgewood and were entirely responsible for all of this

I wish to state that your commonts on the work of Col William If Walker do not really do him justice Colonel Walker took hold of Ldgewood Arsenal when it was in a most chaotic condition and straightened all matters out and he got the personnel working as one matters out and he got the personnel working as out unit. He did the greatest pilet of excultive work that I have ever had the pleasure of being associated with Samuel M Green,

Springfield Mass

#### The Automatic Shovel

To the Pditor of the SCIENTIFIC AMERICAN

In your publication of February 22d, an inquiry is published from W E. Abbott, Murrulen Wingen, N S. W in regard to a digging machine to be operated by the weight of the engine

efore this war I remember having read a deperfore this war I rememoer having read a description in one of the technical monthlies published in Bohamia of a similar machine of a Swiss invention, operating on the same principle of weight of the engine, it works very successfully and a revolution in cultivation of lands has been promised by this machine

On a great cylinder similar to those used on some tractors as a back-wheel a row of spades are attached adjustable to any desired depth to dig in the soil, the weight of the whole machine forcing these spades in the ground and automatically turning it over by the forward movement of the machine. I never noticed anything on this continent of such an invention and it may be interesting to the farm implement manufacturers to investigate and construct machines of such action

s claimed that such a machine works faster and better than any other plowing outfit for great or small

Automatic pyrometers and signal lamps on the heat-treating furnaces in a steel mill

Seven pyrometers which record on one multiple chart, under the control of a single operator who works in a quiet office

# Weighing High Temperatures in an Electric Balance

A New System of Pyrometry that Gives Better Control of Heat Processes

By J. M. Bird

Till manufacture of munitions has brought about a great extunoum the pract to of heat traiting metals which in turn has resulted in rapid development of that art. In particular, it has been demonstrated that a prerequisit to success is ability to gag, with recursey the temperatures employed. Consequently much at tentron has been divorted to the instrument which I obtaining that it from the themometer in its ability to me surretemperatures running up into the lundreds and even thousands of decrees is given the special name performeter.

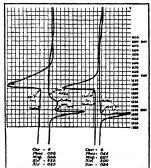

temperatures running up into the unioneous and even thousands of degrees is given the speculi many promoters the thermocouple line coin onto almost universal has been compared to the control of the con

tools so that the two forces oppose one another in the circuit formed by the two pueces.

Under normal irreunstances of course nothing happens. He two forces are equal and opposite they balance off exactly and there is no current through the couple. But it happens that the force generated at either junction warns with the temperature at his tenth of the control of the couple of the control of the control of the couple 
Dynamic montree force may be measured by the strength of the current it produces A coil or winding in linded in the it that it produces A coil or winding in linded in the it that it is suspended near a permanent magnet in such way that the coil or the magnet can move under the influence of the magnetic force set up by the current flowing through the coil. But the force then exerted depends upon several flat tors—the electromotive force they are the total at the coil junction the resistance of the circuit (including the the ranscrape), the lead-wires and the galaximum (i.e. coil) and the strength of the magnetic field. More over the force is usually measured by permitting at to twist or both all a pring included in

the suspension—and the displacement then depends upon the peculiarities and the condition of the spring quite as much as upon the force itself

Changes in any of these factors will affect the result to its necessary when using this method to provide a constant cold-junction temperature. This can be done by means of a steam box an insulating packet, or by burying the cold junction deep in the earth—which is not as inconvenient as it sounds when we consider that

( urves for transformation points of two different steels, showing in each case the heating curve and the cooling curve

the two elements of the thermocouple are frequently series of indefinite length, juned at the ends It is necessary, also, to elements the effects of changes in the custance of the thermocouple, and the lead-wires by issue a galvanometer of high resistance, which would swillow up any changes in the low resistance montioned, and it is mesessary to guard segund physical changes in the galvanometers themselves by frequent calibration But unfortunately high resistance in the galvanometer

necessarily implies small current and correspondingly small power available for the operation of the instrument, in other words, greatly increased delicacy and liability to derangement

An alternative to this a rice of complications as afforded in a recently developed system of temperature control, using the potentionicier. This instrument is the helerical equivalent of the weighing balance. With balance scales, measurements are made by applying variable known weights utility equal the unknown weight. When this occurs, the scales stand at zero, in either pan, they are then and to be balanced. In quite the same fashion, measurements are made with the potentiometer by balancing a known electromicity force against the unknown when they are equal, the index of the instrument a gal anometer needle, stands motionless as it is alternately thrown into and out of the dreunt in the ones of the weighing scales the variable known weights are extirned units separate from the scales the potentioneter provided reasons.

the instrument a gal-anometer needle, stands motioniess as its alternately thrown into and out of the dreuit. In the case of the weighing scales the variable known weights are extraind inits separate from the scales the potentioneter provides its own variable known of the control of the provides of the variable known of the control of

Pyrometer equipment on a heat-treatment furnace of a different type

The recording apparatus that controls the steel-furnace installation shown at the top of the page

heen introduced into the circuit HDGH to offset the force created in the thermocouple

creases as the common opportunity of the thermocouple, this galvanometer, nated of measuring the actual electrometric force, in used merely as a current detector to show when there are occurrent forcing, that the state of the thermocouple, or of the lead-wires, or of the galvanometer, or as to the strength of the magnetic field or the spring tension of the galvanometer, are eliminated, one of these tens has any offect whatever upon the saccuracy of the matrument.

As the length and the resistance of the fead-wires do

As the length and the roustance of the lead-wurse do not master, many different thermocouples can be measured at one central statuon by one operature and one potentismeter, regardless of the distances soparting the couples from the central station Morouver merpensare base-metal thermocouples can be used instead of the society platinum couples, for while the reastance of the base-metal couples in not so constant as that of platinum couples there constants of electromotive force which pyrometry is based in quite as great. Thin with base-metal couples in clud wires can be made of (Constant on page 41).

#### A New Process for Drying Food

THE arguments in favor of delaydratum of food producle are all in and it is to be assumed that they are now sufficiently familiar to us all to make superfluons their repetition here. The verdit seems to be that delay dration has come to stay and that its viry general uswaits merely upon the development of the no essary machines and the nocessary readjustment of the channels of commercial distribution of food.

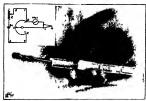

The first of these tions is the one which has received

The first of these items as the one which has received the most startunion, because it naturally comes first. The intangible mechanism of distribution is not going to be modified to give the drier as source of supply of green foods and a market for his waterless product until the tangible machinery for doing the drying is on a basis which will attract capital. We have already discribed in those columns at least two installations for removing the mosture from fresh vegetables and we have pointed to that the one was the logical outcome of the other line the first, are was passed over the material at a temperature sufficient to bring about drying. In this second, the progressive principle of operation was added to make the proper of the outside the progressive principle of operation was added to make the proper of the outside the time that has was an unprovement which would go far forward putting dehydration upon a level of commercial success.

signs a level of commercial success. A group of investigators at Columbia. University beaded by Prof. Ralph H. McKee has been at work for some months on a drying system which marks a branching out in an entirely new direction. The idea behind this undertaking is that the use of the air current should be abandoned altogether and the drying carried out in year to be a great the state of the continent of the state of the

One of the advantages to be derived from successful execution of this idea would be a greater measure of cleanliness, if we are not going to pass a current of air over our food, we are at once discharged from all concern

as to the germ content of that ar Then, too, the aricurrent system can be a real success on progressively, and that implies that the material under treatment is adwanced from one chamber to another wanced from one chamber to another cordingly we get away from a low take up a grocess which is real way from take up a grocess which is real way from take up a grocess which is real way to real manufacture of the raw maserial in one place and leaving place and leaving treatment of the processing the conpleted Mercover, its

A thermocouple of base metals. The insert shows the wiring scheme for the potentiometer

process under uniform sonditions, so we have only one sof of conditions to study and regulate instead of many such sets. And since, we have replaced the principle of the size current by the principle of waxenim we have climinated the endition of humidity such stituting for it the condition of pressure and the extension of the condition of pressure and the —especially when it is necessary to make the former variable

The work of Dr McKee and his associates would have been materially samplified had they been content to

Vacuum-dried meat, and the water that came

attack the problems of vegetable drying alone. But they were eager as already suggested to extend their nethods to the drying of meat and fish, and this in troduced some very special and very trying complica-

What one of these is ean be seen by considering the case of a hard-boiled egg. If dried must is to seer, any conspicuous success, we must be abit to any of it as we have so often said of vegetables dried by one process or an after, that the cellular structure is unimpaired that with the absorption of water, the dried product be comes

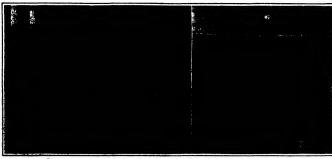

again just like the fresh and when cooked and e tenlooks and tastes and smells just like the fresh. Now when an excus build hard, the allumen becomes

familiar.

As and difficulty has to do with another fundamental component of the met. It was found in an early stage of the experiments that in our rapect various driving was far superior to an drying, alice for means and for expectable. The lon-recitational finite interior tearns off the water recording to whe hit it also carries off a good part of something desertly presents vitamine about which we talk to much nowndays and know so that begins to the begins of the water recording to when the water resorted in the superior tears and the stage of the water recording to when the water recording to which water recording to when the water recording to which we want to be water recording to when the water recording to which water recording to when the water recording to when the water recording to which water recording to which water recording to which water recording to when the water recording to which water recording to which water recording to when the water recording to which water recording to water recording to which water recording to water recor

Before the vacuum drying process can be considered as even on the road to success these were conductions must be met. We must find some way to regulate the temperature and the degree of vacuum not that the albumnas will not coagulate and the fat will not fry out. There price the business is not vet in extre which would warrant the Columbia chemister in telling just how they have met them though the temperature of the chunke in an ordinary. Insile with every trace of water has been chimin stell but which every trace of water has been chimin stell but which every trace of water has been chimin stell but which every trace of water has been chimin stell but which every trace of water has been chimin stell but which every trace of water has been chimin stell but which as stellar from their dryings out that some of these pieces are real with the grain and streak of fat just as Nature made, them. They point that some of these pieces are real with the grain and same text set it indicating that it makes no different how the coverage of the control of the most coverage for the most event of the control of the control of the decision of the process cancer that the process cancer that the control of 
We have indicated that the details of the process cannot be made known as yet a very the very go ard one on which we have already divided that it is a vacuable process. He is not other inter-sting feature which can provide the process of the process of the process. It is a pump and for run a pump requires power. A five-luck gun on wheel mount

N.J. A. Stell

at ADECREEN, Md.

It is interesting to note that figuring the elapsed time between the cutrance of Great Britain into the war and an equal time factor with h considers American production, United States production of mobils artillery reached Great Britain's hyuren is period of 19 months. Looking Great Britain is hyuren in a period of 19 months. Looking Great Britain was already quipped with great ordance factories it is proved that figuring from that time of entry into war. United States production equalled that of Great Britain in a period amounting to two months less than it required Great Britain to accomplish similar results. Notice, too, should be taken of the fact that the United States furnished to Great Britain from 1915 on during the period of the war a total of 1380 gues of calibers varying from 3-inch up to 8- and 9-3-inch. During the same period the United States also furnished Great Britain a total of 114 gun carriages Incidentally, too, the United States (unished to Great Britain at 143 300 000 obtail of various calibers from the field gun up to 12 and 15 inches

Necessity for the New Proving Greend

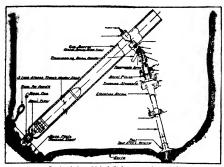

Necessity for the New Proving Greend

Necessity for the New Proving Grou The necessity for the purchase and development of the great proving ground at Aberdeen was found in the fast that the famous Sandy Hook Proving Ground, established the famous Sandy Hook Proving Ground (1998) and the famous Sandy Hook Proving Ground (1998) an lished in 1874 was altogether inadequate to meet the enormous demands imposed upon us by the great war eatermous demands imposed upon us by the great was Sandy Hook a narrow pennisula five miles long, was and continued for many years to be fairly adequate for the ordinance of thost days when the largest gun was the 15-inch Rodman amouth bore, and rifled guns were the 16-men rooman smooth over, and rined guns were being experimented with and high explosives and smoke-less powder were unknown Ranges were extremely moderate judged by present day standards Indeed, a letter from the commanding officer, New York Arrean! to the Chef of Ordnance in 1874 made

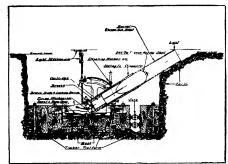

Many of our oider 35-cal 8-inch guns, good for high-angle fire, were placed on railway mounts. Note the lateral struts for steadying our against the recoil

One of the French type, 185-mm. gans

Foundations, etc , of a 240-mm trench mortar showing the shell

this interesting statement Ranges from 1 700 to 2 000 yards can be readily obtained on this reservation (Sandy Hook), and if deemed important these distances can be considerably extended within the limits of the reservation.

ration." The necessity for such a vast proving ground at Abardean will be understood if we consider the volume and diversity of the work done there. In the first place every new type of gun, gun carrage, projectile, explosurings, and a hundred other dovines pertaining to ordnance, must be rigidly tested at a proving ground before it can be approved for general use. The necessity for making dangerous things safe to handle requires more prolonged and careful testing than is the case with most manufactured articles. Thus, to test a nagle type of gun carrage alone, 0,000 shots were first at Abardean Many thousand rounds are required to test even a single-design of fuse.

design of fue Again, a sample of every lot of ordnance material manufactured must be tested to determine whether it conforms to appendentents. However reliable a manufacturer may be soldiers lives cannot be repartited by allowing possibly defective ammunition to go untested. The proportion of manufactured ammunition steeted is small, usually one-tent hot one per cent but every gan and carriage must be put to the proof individually. Thirdly, the divensity of the activities and the necessity for their freedom from dangerous interference with

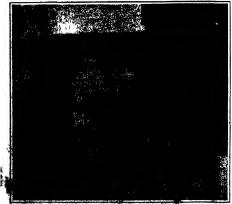

sity for their freedom from dangerous interference with each other were of great importance in demanding the large area purchased as will be shown by the summary

Aberdeen proving ground, area, 35 000 acres, length, 15 miles. Note observation towers, on eastern shore, to plot the fall of shells

The proving ground includes a trench warf ire range where a large volume of firing it short ranges wont on a main battery where non-explesive projectiles were fired main battery where homeopies we projections were more to test power and guns a water range where the splashes made by falling projections were accurately aported by observers several detonating ranges where officers watched bursting shell from bomb proofs close to the line of fire and recovery fields where shell fired in the morning could be dug up in the afternoon Then in the moraing could be dig up in the afternoon. Their an avaition field with hanges and shops a boming field where avaitors could drop explosive bombs and an anti arraft fining range were needed. All these wire artually provided for in the Aberdeen reservation and Compowder Neck was still left for the gas plant. However no room could be found for a firing range for teving gas shell and a new Proving foroutal had to be celablahed at Lakeburst for this purpose. The contract of the street of the country for shell in the country of the country

Consideration area wint a constring guil or a major entirer, shell airsking an armor plate may project a fragment to the distance of a mile. Again a high explasive shell may receive to a risking the ground and be deflected far to one side of the point asmed at While it is possible to crowd Prusing Ground settivities togs their to a dangerous degree the lives of persons outside the grounds should be protected and so a neutral zone must be maintained inside the b undary

# What is a Man-Hour Worth in Your Plant?

To the worker at the machine, the value of a man-hour is one thing—to you, as his employer, it is another.

The value to him is fixed by his pay check. To you it is fixed by what he produces in that hour—and these two values must be in proper relation, one to the other.

That is why manufacturers today are busy on the problem of increasing man-hour value to them. They cannot add to the hour—they must add to the man.

How? Not by increasing his burdens, not by a driving effort, but by the one way which is logical—increasing his efficiency.

Few things are more important here than the character of the power that turns the wheels and the way this power is applied.

When electricity is harnessed to the modern machine tool, the value of the man-hour at once takes an upward bound, because electricity is the one form of power with which a lathe, a drill, a grinder or any other machine may be run swiftly for this task, slowly for that—always at a speed correct for best results. Moreover, every machine

can be placed in the spot most convenient for production. Another important factor is the elimination of belts, which makes effective artificial lighting much easier.

Westinghouse Motors have taken a conspicuous part in multiplying the value of man-hours in thousands of manufacturing plants in practically every industry ever since the day, over 30 years ago, when the electric motor was first applied to industrial machinery. And not only did Westinghouse introduce the Alternating-Current Induction Motor, but the Synchronous Converter as well, so that alternating and direct current became available from the same supply line.

ESTINGHOU!

In applying motors to so many industries Westinghouse engineers have learned not only the power requirements of this machine and that, but the principles and practices of thousands of industries. When you buy Westinghouse Motors you buy not only machines well built mechanically and electrically, but service that can be offered only by men as thoroughly experienced as are the engineers and industrial specialists whose counsel and advice are always offered to the purchasers of these motors.

### Suiting the Heating Tip to the Work

rail ends I Natempting to increase the rate of soldering the caps on the square tops of metal eartons used to carry bacut to the Army during the war it was found that the usual type of electric soldering row was not as effective as a newly invented baster which was developed as a result of the need for speed in this work. In this device a larger surface of the heated portion touches the metal of the carton and

less current is required than with the ordinary electric soldering iron. The design is radically different, the two design as radically different, the two heater untils being secured to the in-sides of two cast iron pieces, between which a flat har of copper about 1½ inches wide by ½-inch thick is clamped. This extends at one and and the heat generated in the flat heater units is transmitted to the copper bar, the end of which is the soldering tup and the heate up a good part of the metal carton cap at one time When the copper bar wears it is easily extended by unloosening the clamps and when not enough is left to be in contact with the heater units, another bar is put in to replace it.
This type of soldering device may be provided with a curved piece of copper instead of a flat bar to suit it to cartons of other shapes. A handle may be attached or a bracket for mounting on

# WALTHAM THE SCIENTIFICALLY BUILT WATCH

### Know the "Works" of a Watch Before You Buy It

THE watch presents the same elements of mystery that once surrounded the automobile Now, nearly every one knows something about a motor car's mechanism. It is to make the "works" of the watch an "open book" that these Waltham ulvertisements are designed to instruct and protect you in buying a watch

The mainspring is the power of a watch. It is a piece of specially hardened and tempered steel, about twenty inches long coiled in a barrel between the upper and lower plates of the movement.

It is subjected to virying conditions of service in temperature and tension. The variation in thickness of two one-thousandths of an inch, or lack of uniformity in hardening and tempering, will decide the time-keeping quality of your watch.

The Waltham Watch Company produces fourteen tons of mainsprings every year. It is the largest mainspring maker in the world. The Waltham mainspring is cut from long rolls of steel of uniform and special quality, then tempered in resilient form by a secret process, and is placed in the watch coiled into a hardened and tempered steel barrel. This process originated at Waltham.

The foreign mainspring is not only cut in short lengths, but hardened and tempered in short lengths—therefore every foreign mainspring is an individual spring of uncertain temper, making the watch a liability.

The foreign maker of watch movements buys his springs in the open market. That is one reason why the imported watch gives such varying service. An inferior mainspring me is an inferior watch—no matter how much you pay for it.

The uniform superiority of the Waltham mainspring is one of the reasons why the horological experts of the leading nations of five continents chose Waltham in preference to watches of any other make.

One day some one had a bright idea and saked him if ht d like to fly an American plane The Boche thought he would Maybe he thought he could put something over! So they asked him, if they let him, would be give his parole not to try to get away Very properly he told 'em the German for 'nothing doing in the parole line' And that made em laugh and they told him to that made en laugh and they told him to that made en laugh and they told him to that in an a machine, and get away if he climit into a machine, and get away if he few rings 'round him had hereds him all over the atmosphere and finally made him fly down and land where he started from I run develtry and if G H Q ever heard about it, heaven only know what they would have done but no one told 'But the point I m making right here is this Show me the American airman or the British airman, captured by the Boches and allowed to get up in the sir, who wouldn't have eather got away or crashed trying, and I'll show you as airman who doesn't belong!

'The Spad sin't a bad machine, you know 'C and did not not not machine, you know 'C and did not not not machine, you know 'C and did not not not not make the contract of the contract o

know You can dive with your engine full on and stay together when you flatten out But the Fokker has fewer blind spots out But the Fokker has fewer blind spots than a Spad-much better visibility I'm not sure that an't why the mortainty was so heavy among the U S boys in the aff. The mortainty was 50 per cent at least for the war I know of one day-bombung squadron that lost 60 per cent of its mee in one day, and that's sure burning up airmen to make a German boliday. But don't let any one think I'm knock-

ing the best little nucleus of airmen in the world The Boche knew that, they didn't

in note as a sign the contract their nitrots in the world. The Boeche knew that, they didn't and of Food had only had parents or summer to evertous and the serious of the world. Our terminal parents or summer to evertous and the serious of the world of Food had only had parents or summer to evertous and the serious of the serious of the world of the serious of the world of the wo

The demand for electric starting and lighting systems necessitates the storage battery.

It is much cheaper for passenger car manufacturers to utilize these batteries for ignition than to entail the further expense of installing magnetos, but—

Why do the gigantic trucks of commerce use magneto ignition almost exclusively?

Why did General Pershing cable instructions that all trucks sent him should be magneto equipped?

Why did magneto ignition prove itself the only entirely dependable ignition for the war's fighting airplanes?

Because magneto ignition is the only entirely dependable ignition.

The Splitdorf Aero Magneto was developed and standardized for the U. S.War Department and officially adopted for use on the air program.

Changed in outside appearance, but containing every feature that proved itself in the test of war—the Aero is now firing the engines of America's passenger cars and trucks.

No engine dependable without a magneto.

### Supplying the British Farmer with the Sinews of War

(( nitinued from page 429) as possible to be made in this country and if was expected that over 60 would be available in time for the spring plowing In addition to the above supplies order borse drawn implements both for cultivation and harvesting and arrange-ments have been made not only to guard against a depletion of the existing supply of agricultural horses but to pur in ad litional 20 000 horses which with the increase I supply of plowinen, will be urgently required to carry out the in-

creased tillage program during the winter and spring mouths A different problem was presented in the case of fertilizers. The position in 1916 was briefly as follows. The supply of potash for which Britain has depended on The position in 1916 ows The supply of the rich deposits in Germany had been cut off. The usual quantity of sulfate of

ammount was available a large amount, but only small supplies of Chili nitrates had been forthcoming phosphatic manuns there was a considerable amount of base slag available from the steel works but additional grinding machinery was required in the case of superphosphiate the supply was limited by the munitions demands for sulfure acid

Fortunately it was found practicable to recover considerable supplies of potash from flux dust and a limited quantity was got in time for use with the 1918 crup while it is hoped to secure a greatly intra led aumonia owing to have reards suffer and aumonia owing to active propagands among farmers for an increased use of the fertilizer the consumption has arisen from 78 000 tons in 1916 to close on 180 000 tons in 1917 I xports have been prohibited so that as far as possible the whole output might be available for food production and munition individual in the United Angions In the case of phosphatic manures returns obtained in the spring of 1917 from the manufacturers showed that while some firms had supplies of acid they were short. of phosphate rock and the tersa Steps were accordingly taken to pool supplies with a view to more immediate produ

The provision of a proper supply of seeds and the control of prices have proved also matters of considerable importance In moure against the possible shortage of seed wheat for sowing in the antiums of suditions the bond Production Departminutees 2 000 quarters of seed wheat

tion through the War Agricultural Ex-excutive Committees was of great assustance t the allotments in a critical season. For 1918 steps were taken to provide 10,000 tons of tons of immune varieties for districts allected with wart disease to provide not less than 10 000 tons of non-immune varaties for small growers in other districts and to arrange for the planting with imand Ireland in order to furnish seed for and retained in order to turnish seed for infected areas in 1919. A vigorous cam-juigin was carried on by the Departments of Agriculture in all parts of the United Lingdom for the spraying of potatous against blight

Attention having been drawn to the mun factors in the agricultural program of 1917 the results as represented in the acreage and produce of crops may be briefly stated. Here however, it is necessarring and product of crops may be limitly stated. Here however, it is neces-sary to hear in mind that, while in the United Kingdom the tillage area for 1917 was increased altogether by nearly one was increased altogether by nearly one million acres, the evidence at the end of 1916 pointed to a fall in the area under crups in the 1917 season. Thus the effect crups in the 1917 season. Thus the effect of the campaign has to be judged not only by the actual increase realised but by the fact that a decline in the tillage area had been checked.

nea teen theeked Considered in groater detail, the returns of acreage of crops in the United Kingdom for 1917 show an increase of 50,000 acres in wheat of 140,000 acres in burley, of 616,000 acres in oats and of 220,000 acres of putations. The area under oats in 1917, 47(1),000 acres in the highest control of the property of the of the proper

4 761 000 aercson record in the United kingdom while the scrage under potatoes is the larges

It is estimated that the yield of wheat of burier by the same amount, and of oats by over 30 000 000 bushels to over 30 000 000 bushels. In potatoes where the season was exceedingly favorable for the crap despite the shortage of putash the yield is one of the highest on record the total crop exceeding that of 1916 by at least 3 000 000 tons, and the average er p of the preceding 10 years by 2 000,000 time. Altogether it may be said that the tiliage campaign resulted in the addition of not less than 600 into tons of cereal

find and 1500 000 tons of potatoes or agricultural land the shawing for 1918 is quite as favorable but shows of course no notable in-ercase over 1917. It was in the last-named ve ir that the machinery of war-time agricul time gut under full headway, and it this reason that we speak so much of 1917 ruber than later years. The outlook for the present and future is bright. Nothing has been more striking than the gene ra officiency and whole hearted loyalty of the throughout the country in carrying out thin novel and heavy duties and it is no exaggiration to say that these committee have succeeded in raising the whole stand art of farming and in creating a strong public opinion against the neglect or ing use of land which might be producing feed for the nation

### Eight Months Without A Day Off

Over a period of eight months, with loads running as high as three tons, the Franklin Hardware Company of New York, has operated its 13/2-ton Fulton Truck, without a lay-off of a single day for repairs.

The average daily mileage has been between 40 and 50 miles; the average gasoline consumption, 14 to 15 miles to the gallon!

This Fulton has replaced two one-ton trucks of another make, covering the same ground, and saving costs of gas, oil, and of the extra driver.

Where speed, economy and absolute dependability are essentials, the demand is for Fulton Trucks. Such large fleet operators as Standard Oil Co., Pittsburgh Plate Glass Co., Valvoline Oil Co., John Wanamaker, Texas Oil Co., etc., are using Fultons for their big haulage, under all-road, all load conditions.

The Fulton Triple-Heated-Gas Motor is an important factor in the Fulton low-cost, high mileage performance. Behind the Truck are the Veteran Fulton organization and the largest factory in the world devoted exclusively to the manufacture of a single model 13-ston Truck.

There are important facts for you in Fulton owner records.

is the most significant feature of the new

Another sutcreating application of the wtentiometer outht is in connection with the preliminary experimental work neces sary before heat treatment methods can be standardized. With all metals, there are standardized with all metals, there are certain well defined transformation points or critical points—temperatures at which oh mit if or physical changes take place The operations of hardening, working annealing and tempering must be carried out at temperatures hearing a definite re-lationship to the critical ones and it is accordingly necessary to determine the

latter with accuracy When a substance is heated to a trans-

formation point and allowed there to undergo the transformation the latent heit necessary to do the work of the formation point and allowed there to opposite the Susquehanas basin to the undergo the transformation the latent (unprowder River, a datance of about heat increasery to do the work of the fifteen miles. Barracks, officer quastrers without mirrasing the temporature of the total proving batteries are situated mean without mirrasing the temporature of the total proving the temporature of the sustained barracks, officer quastrers without mirrasing the temporature of the sustained proving of transformation is marked by Gunpowder Neck is occupied by the gas not considered to the sustained by the gas the sustained by ing drop in temperature. Now when we boil or solidify or melt or condense a substance we cannot watch it and state at what moment the transformation takes place things do not melt suddenly, after the fashion of an explosion. But if we know that the transformation is marked by constant temperature a temperature that remains fixed in spite of the absorption or evolution of considerable quantities of heat, we can use the recording pyrometer to locate the entical temperature with the greatest case and accuracy

In practice the sample under test and another body liaving no transformation another hody inving no transformation points within the rangi to be studied, are heated in close contact without another. This second body is termed the sample holder. It will become uniformly hotter holder. It will become unitoring notice (or colder) throughout the test while the sample will fail to do this when its trans-formation point is reached. Accordingly the difference in temperature between the two bodies normally zero or almost zero will take a sudden keep when the trans-formation point is reached

We must measure both the actual temperature of the sample and this temperature difference. The first of these obperture of the sample and this tem-perature difference. The first of these ob-servations is made by mount of a po-tention eter circuit in the regular way. The second is effected through a pyrometer Its second is effected through a pyrometer which his inseted of the more regular hot all cold junctions one junction in contact with this sample and one in contact with this holder. In this way it is construed to record not the difference between a known twed and an unknown versible temperature but rether the difference between two variable temperature. Temperatures are plotted as on coordinate the corresponding temcrature differences at another

(return differences at another bolds are assuped and sample holds assuped and sample holds are assuped and sample holds as the treath wafare range also are extracted house in the temperature difference. But such that the unperature of the sample remains statuonary or lags belind that of stated that the Allies asked us to concern the holds of the a transformation in the transformation in the grant on large realized-remount guins, and in sample the temperature difference underi.e. a change Illus change miny not be, in absolute figures, a large mar But the lift rent. was zero, or approximately 21 so any change whatever is bound to b on a percentage basis, a large one, mutually suited to boung well brought ut on the graphend record

### America's Great Effort in Ordnance

(Continued from page 423)

The Aberdeen Proving Ground consists of a tract of land about 35,000 sares in area, situated along the western shore of the upper arm of the Chesapeake Bay in Harford County Md It takes its name from the small town of Aberdeen, which is attuthe small town of Aberdeen, when is atta-ated about four inless west of the camp headquarters. The project was a war measure and it was completely planned and executed since April, 1917. It will be executed since April, 1911 It will be continued as a permanent experimental firing ground. The reservation extends along the Bay Shore as shown on the accompanying map from Swan Creek opposite the Susquehanna basin to the

The purchase of the land was approved by Congress early in October, 1917 The surveys were undertaken four days later and the first shot was fired on January 2d 1918 in the inidst of a violent snowstorm Since that time, construction work and firing proceeded in unison. Today there are quarters for some 8,000 men on the post and there have been invested in con-struction some \$10,000,000 Over 400,000 rounds of minor medium and major caliber ammunition have been fired. As a comparison with previous conditions before the war it is interesting to note that on a single day about 7,600 rounds were fired at Aberdeen—thore than were fired in the whole year of 1916 at Sandy Hook

### The Proof Rettories and Runnes

The majority of the proof ranges and hatterion are attuated adjoining the barracks for officers etc., near the northern end of the reservation. There are five parallel ranges each extending generally in a southwesterly direction and inclined at a slight angle with the Bay Shore. In that direction there is available a range on land of 1 miles and a clear range, over water of 1 miles and a clear range, over water of 1 miles and a clear range.

40 miles

The length of the main proof battery The length of the main proof battery is 2500 fct. and here are tested the following guins 37 mm guin 75 mm guin 18 mm guin 47-inch guin, 155 mm howiter 185-imin guin 5-inch guin, 6-inch guin 8-inch lowitter; 40-inch howitter; 40-mm howitter; 12-inch howitter 340-mm howitter; 12-inch howitter 340-mm for the star land range is 15 miles but range in pto 175 miles tan be obtained over water. The trench warfare range has a total length of 1 000 feet and the mortars tested there are the 3-meh Stokes 4-meh Stokes 6-meh Newton Stokes 240-mm trench mortars rifle grenades, and hand grenades

this direction we produced some exceed-ingly fine artillery, the test of which took place on a railway-mount range, which is made up of about ten tracks, so arranged that the guns on these tracks will have a clear range up to 75 miles. Fleetrie or gasoline locomotives are always on hand at this range to assist in placing the guns

In addition to the ranges above men-In addition to the ranges above mentioned there, what is called a water range The firing is done down the Chesapeake Bay and the fall of shots is over a shoal which extends approximately down the conter of the Bay and is, therefore, well clear of all shipping. The spisah of the shots as they fall into the water is recorded from 13 towers built on the western above of the Bay, in which observers are stationed. These observers that a reading the state of the Bay, in which observers are stationed.

On account of the percentage of large shells lost beyond recovery because they penetrated below the water level of the marshy soil, a concrete tank of large dimensions was built, into which the projection to be tested will be fired at close ranges. We had the pleasure of seeing a test of this tank and it promises to form a valuable feature of future Proving Ground work

I imitations of space prevent entering in any more detail into a description of the any more detail into a description of the enormous activities at Aberdeen, but we will dose by giving some particulars of the rounds fired since the organization of the establishment From January 1st, 1918, December 31st, 1918, a total number o 450 000 rounds was fired, the month of greatest activity was August in which 71 000 rounds were fired, the maximum week was August 10th to 17th, in which 21 000 rounds were fired, the maximum day was August 9th in which 7,700 rounds were fired

In conclusion we wish to express our indebtedness to (of William A Phillips, commanding officer at Aberdoen, and to Major I P Lindh, for courtesies extended during our visit to the Proving Ground

### Portable Rail Sawing Machines

(Continued from page 438)

larger size can be cut. These machines harger size can no cut inose machines have 18-inch diameter saw blades and special semi-high or high-speed steel blades are utilised, the high-speed blades being used for cutting high-carbon open-hearth saw is especially necessary when the and new rails installed in places. The worn or battered ends of old rails may be sawed off in track, instead of being trans-ported to shop or mill like life of many old rails is thereby greatly prolonged for service. After a cut has been made, it is only necessary to release the rail clamping device and throw the roller at the rear of the machine into position on the rail weight is then carried by the roller and machine will slide to the next position

max hine will slide to the next position.

There has been provided on the moderdrivers saw a friction device on the vertical
operate at a reduced speed when cutting
rails with hard spots and there has been
designed a compact, but efficient, saw
grinder for sharpening blades, which can
be attached to a break in the shop or on the
particular power plant. This grinder operaries in a speed of about 1,200 revolutions

### The Crystal Structure of Ice

THE X-ray study of the crystal structure of ice by a promunent scientist was rendered difficult by the fact that the rays tend to melt and to sublime the ice In a first attempt to turn the difficulty the and a next steempt to turn the dimonity has whole system was encased and cooled by see and sait, later a small ammonia machine was used which stopped the melting but not the sublimation of the ice, finally the crystals were encased in galeatin capsules in which they could be preserved for days. The isolation of a crystal also caused diffiin which they could be preserved for days. The isolation of a crystal also caused difficulties The prismatic commercial ice, unsuitable for examination, from a layer of ice 2 millimeters in thickness, produced of to 2 millimeters in thekkness, produced by pouring water into a pan, individual crystals could hardly be extracted, finally ice was frome out of a weak ast solution which yielded crystals with distinct cleav-ters are solved to the product of the country of hazagonal, as is generally seaumed, and could be referred to four inter-panetrashing triaggular paper listines, and to two assess meeting at an angle of 120 degrees, and a thirty casts vertical to the fewer.

A row of buildings on the water-front is ablaze Heavily stored ware houses are threatened A liner freighted with humin lives and costly cargo, is tied up at the pier

Complete destruction seems inevitable

But the fire-boat is coming! Soon a whole broadside of water—50 tons a minute—is tearing into the flames with an impact so powerful that walls tuinble and roofs are ripped away.

And what is back of this tremendous force

Rubber—that multiform material which has become so helpful an ally to man—a substance that has given him control over the most destructive of all elements—fire

The endless flood of water shooting into the flames, passes through fire hose that is lined with rubber

And the steam hose is rubber Rubber is in the packing of gates pumps pipe-lines and propeller stuffing box. It is used for the big suction and duscharge valves and for washers and gaskets of many kinds

Even in less conspicuous details, rubber is freely used. Insulation is made of it, so are the coats and boots of firemen. Floors, stairs and plat forms are covered with it. No matter where you turn you will find rubber in some one of its myriad forms.

And most of the rubber you see came from one or another of the 47 mills of the world's largest rubber manufacturer whose products bear the well-known U. S seal

Consult our engineering bureau regarding your rubber requirements. You can get in touch with it through any of our numerous branches

### **United States Rubber Company**

How did you feel last April?

"If the War would only end I'd give anything"

HOW often in the long long days of last winter did you say that to yourself? The shadow of war was on the land. The boys were going—perhaps your boys. You said. I d give anything and you meant it

Now the war is over Over because of the bravery of our boys Over because those boys were given the huge quantities of munitions necessary for victory

Now the price of Victory must be paid

The money from the Victory Liberty Loan is to pay for the shot shells guns ships and other supplies which made the warend sooner. Our Government spent money—huge quantities of money because it knew that you and I and every American preferred to spend money instead of lives. If it skimped on money more lives would have been lost—and the war might still be going on

This loan is a challenge to our honesty—a trial of our patriotism. Are we going back on our spoken and unspoken promise—I d give anything?

Ask yourself that and then subscribe to the very limit of your ability Ask yourself what it is worth to you to have peace and then increase your subscription accordingly

### THE WHITE HEAVY DUTY TRUCK

with

### DOUBLE REDUCTION GEAR DRIVE

Having all the leverage and flexibility of a chain and sprocket and the frictionless driving contact of gears which roll in oil, dust proof

### A New Low Cost of Heavy Haulage

The new White heavy duty trucks have been designed with but one end in view: to do more work at lower cost. They carry forward the White policy of building trucks to do the most work with the least effort.

For years the chain-driven White has set the pace in heavy haulage. It has held its own against a field of competition based on new axle features. It has won its place by sheer merit as a truck, and not because of any single feature in it. It is standard today in America's greatest fleets.

In White Trucks, mechanical changes are made only to improve operation. The company has always sold operating efficiency—truck performance.

The heavy duty models remained chain-driven until we were able to develop an enclosed form of drive having all the advantages of chain and sprocket. This has now been done. The Double Reduction Gear Drive is the full counterpart of chains in applying power. It has the chain pull, in gear form.

The new trucks follow a twofold aim in White design: sturdy engine up in front and maximum pull in the rear. The final drive saves power and therefore fuel. The lubrication saves oil. Light unsprung weight saves tires. Continuous operation saves time of both truck and driver by a steady volume of performance.

In all its years of transportation service, The White Company has never swerved from its original purpose to build an economical truck.

These new trucks are money savers.

THE WHITE COMPANY

CLEVELAND

You will say rock-of course-because it has withstood the destructive action of the elements for centuries Then why not insist on a roofing made from rock fibre instead of roofing made from rags or other organic materials

Asbestos is the only known mineral fibre from which roofing can be made It will permanently resist the destructive action of time and the elements and the ravages of fire

Asbestone is a Johns Manv lie Roofing made of Asbestos rock fibre which repels fire and resists the action of fumes acids and varying weather conditions. Being all mineral, it cannot rot, disintegrate or dry out Therefore painting is never required. Asbestone is a mineral fabric composed of imperishable Asbestos fibre waterproofed

with natural asphalts. It has a gray mottled Asbestic finish on one side smooth black surface on the other Can be laid either side to the weather Rolls contain all necessary steners for laying.

### PACKARD TRUCKS AS GOOD-WILL BUILDERS

Establish Confidence in Delivery Safeguard Hauling Contracts

Lower Transportation Costs

NE of our most successful merchants says that before buying new fixtures or equipment he asks himself: "What will our

customers think about it?"

Nothing earns money on the customers' good opinion quicker than delivery equipment.

This is just as true of a coal yard as it is of a department store. As true for the hauling contractor as the local express company.

What people think of the Packard Truck is based upon how they have been served by it. Packard Trucks have served better because they were sold to serve.

If a merchant wanted just a truck he rarely got a Packard. If he wanted a truck transportation job done right, permanently and at the lowest cost—you were practically certain to see some Packards running around with his sign on them.

And so the public have come to believe that Packard and good service go together.

r r e

Naturally, some business men will praise the idea of buying trucks on a transportation basis but will try to beat the Packard method. It cannot be done.

Nobody has a patent on the plan, but trying to carry it out with the ordinary motor truck, only serves to show up the truck.

To make it work—to make your truck transportation costs a definite, predeterminate figure, low enough to meet all competition—you must take equally good engineering design, equal stamina, equal long life with the Packard Truck.

Everybody knows the Packard reputation. You've heard about the many Packard Trucks now running that have travelled more than one hundred thousand miles.

Which will a business man do? Pay \$3,000 for 50,000 miles—or pay \$4,000 for 100,000?

Investan extra thousand dollars to insure minimum transportation cost—or pay out that thousand in repair bills that were not in his original estimate?

Anybody can recite the theory of cutting down transportation costs. The Packard Freight Transportation Department can give actual facts and figures. Their services are available to any business man—by telephone, mail, or at the local Packard showroom.

The fidst is glit line submitted to him timely irts les suitalli f lies lumis especially when such articles are or mpinilly ph t griple

I do not know whether we favor a loague of Nutions or not of Nutions or not we are not sure what sort of a League we would have if we could But we are entirely clear that in the organicuts against the League there is to be found a vast amount of sheer HONSONS

A favorite plea against the Langue so far as the United States is concerned is that it is unconstitutional The right to make war and peace resides under our Constitution, with the Congress If we enter a League of Nations we agree not to make war and the Congress loses its constitutional rights in the premises Or, perhaps the constitutional aspect is not emphasized perhaps we are solemnly told that we as a nation must not give up our (cod-given privilege of making war when and upon whom we please

Very good But what is the difference between treaty with one nation and a treaty with a score of nations? Peace can be made only by a treaty, in any event and our treaties we hope, are binding So the moment we make a treaty of peace we are bound not to make war, except in defence of the terms of the treaty Then, whether we put the matter upon the basis of constitutionality or upon the basis of our own inherent right to make war when we want to, peace is objectionable

If you can make a prace treaty with one nation you can make one with a dozen You can make one with the world If you can t make a peace treaty on a large you can't make one on a small scale There is no middle ground either peace is unconstitutional, or it isn t Ho says a correspondent of the New York Times and we must agree with him

to our humble intellect it seems just as reasonable to object to law and order on the ground that it prevents us from assaulting our is xt-door neighbor when the spirit moves us that it forces us to settle our grievances with him through a legal procedure which imperils our rights as it is to object to a I eague of Nati ns on a similar ground

We be always supposed that the prime object of a League of Nations was to prevent war. It seems a trifle curious to have it violently objected to because it threatens to accomplish just that purpose

### What the Weather Man Thinks of Ocean Flying

THERF has of course been v luminous discussion of the trins Atlanta flight but with few exceptions this is centered around the me hanical festures my lyed. Now this is altogether necessary and proper but t has the mechanical side of the crean flight has been devel ped to precisely the point when naderation of an ther ospect of the case is in order

It is no longer problematical whether a plane can to built for which a flight of tions Atlantic distance is a phy i d p subdity this questi it is conceded to have been answered athrmatively. On the other hand while we may yell ope for the day when any plane of adequate are that a fact take the air at all may be pointed for the other sale of the wirld with assurance of getting there, we are still a long way from this consummation

If, then an arrplane today can make the crossing, while a green air plane will probably fail the determining factor between success and failure is external conditions

in the case of the airplane external conditions means the weather True, weather conditions have been mentioned freely in connection with the efforts now being made to win that \$50 000 but they have been mentioned in a wholly insufficient way If the weather on its face is bad the aviator will keep out of the air if the weather looks as though it might be favorable he will start and trust to a benevolent Providence to see him safely across This does not constitute adequate discussion of a determining fact ir

Weather is a complex of temperature humidity pressure wind direction and velocity precipitation. On all these heads there is much to be said with regard to the diff rance between conditions at the surface and above it letween conditions over land and over water. There is much to be said much even to be learned with regard to average and extreme values under each head mentioned with regard to seasonal and local and casual variations with regard to protable values at a given time and place with regard to the effect of each of these factors upon the functioning of plant and pilot There are special ramifications to be discussed with regard to fog its altitude duration and extent and with regard to other items of equally special n ture

A compilete n of what we know and what we hope to and out under each of these heads is essential to flight across the ocean on any basis other than that of a sporting proposition with death Accordingly the United States Wenther Bureau has assigned on fits meteorologists to investigate the subject and am ug his duties is that of being present at the starting p int of trans-Atlantic flight to advise the aviators upon weather conditions Lurther than this he has prepared a statement showing just what bearing the meteorelosical conditions known and suspected to exist along the probable routes of flight may have upon the success of the venture. This statement considers the various questions which we have suggested and disposes of them se far as it is possible to do so On the whole, it is a real contribution to the literature of the subject, and we have decided to print it in the Suill EMPNY as such The tirst installment will appear under the above title in the current issue, and it will be completed next week. It will be found that Mr Gregg has information and suggestions of extreme value to the ocean flyer

### Jellicoe at Jutland

NIFREST in Admiral Jellicoe s story of the Grand Fleet culminates of course in the Battle of Jutland the account of which is given in the same simple and straightforward fashion that characterizes his whole book It is evident the Admiral feels that he has nothing to conceal nothing that calls for apology He makes the frank admission that in many respects the German fleet though less numerous was ship for ship, superior to his own being more heavily armored with better under-water protection possessing better rangefinders better searchlights, a more numerous destroyer fleet (88 destroyers to his own 80) and that it was more completely provided with torpedoes the German destroyers carrying mx torpedoes to the British four and their battleships carrying from five to six submerged turpe do tubes as against from two to four tubes in his own ships Although Jellicoe had 27 battleships in line against the German 17, the Cormans possessed five destrayers per ship, the British only three per ship

We give these details because it is very evident that it os the formidable nature of modern torpedo attack that controlled Admiral Jellicoe's tactics both in his deployment on getting within range of the enemy battleship fleet and also in his disposition of the Grand I hat for the night, after the German fleet turned away to the west under cover of a protecting smoke screen raised by its destroyer flotillas

As every one knows, a violent controversy has arisen m ( reat Britain over these very tactics of Admiral Jellicor He is accused of having fought with overcaution Comparison is made with the dashing attacks which carried Nelson to victory But, as Jellicoe very pustly states there is no parallel to be drawn between Traisigar and Jutland The High Sea Fleet repres everything in the way of first-line ships that Great Everytung in the way of mit-ine amps that Great
In view of the lact that there was no reserve of dreadmought reserves, whereas 'in addition to Nelson's superiority, algoridge the schole Allsed cause, we believe
force of 26 capital ships and 19 frigulas, the navy in
1805 had momission in home waters and the Angelles where the schole and the reserves in the schole and the schole

and 50 frigates" Furthermore, when Trafalgar was fought, an additional 32 ships-of-the-line were building in England and 10 in Russia, whereas only five capital ships were under construction in England when Jutland was fought

When Jelkeon obtained definite information of the position of the German fleet, he was coming down from position of the German need, he was coming down from the north-east with his battleships disposed in six parallel columns with a distance of about one mile between columns. The German battleships, in line of battle (single column) were coming up from the south When first sighted the liesd of the German line bore about southeast from the head of the starboard or right column of the British fleet, distance about 13,000 yards It was now necessary for Jelheos to deploy, t s, form his fleet into one long line of battle. This is done by the leading ship of each column turning say 90 degrees to port or starboard the slups of each column following its If Jellicoe deployed to the starboard, it would bring his flast on a converging line and therefore nearer to the German destroyers, if he deployed to port his fleet would turn somewhat away, and the range would be lengthened For what seem to us to be sound tactical reasons he deployed to port-and for this he has been most savagely entirised

But let the Admiral speak for himself "My first and natural impulse was to form on the starboard wing column, in order to bring the ficet into action at the earliest possible moment but the sound of gunfire, the German fleet was not yet visible through the must, showed that the High Ses Fleet was in such close as to create obvious desadvantages in proximity such a movement I assumed that the German destroyers would be shead of their Battle Fleet, and .
it would be suitidal to place my Battle Fleet in a pos-

tion where it would be open to attack by destroyer during such a deployment, as such an event would throw the fleet into confusion at a critical moment In this connection it should be noted that 20 torpedoes passed through a single division of his battleships and were avoided only by quick changes of course

Further considerations were that the starboard divisions, nearest the enemy, were composed of the earlier ships, "with only indifferent protection as compared with the German capital ships," and since it would take 20 minutes to complete the formation of the line of battle' and the starboard divisions would have to execute a large turn under the concentrated fire of the best German ships at a range of 13,000 yards and less, Juliance deployed to port

Thereafter, with Beatty and his battle-cruisers leading the line, the great battle between the 55 capital ship was on The German tactios consisted of repeated destroyer attacks, followed by emission by them of smoke-screens, under cover of which the Germans or tinually turned away, especially when they came under heavy gun-file This continual turning of the German fleet to the starboard caused the action to take place in two roughly concentric curves, with the Germans on the inner and smaller circle, so that in this intermittent daylight action, which was interrupted frequently by the thick hase, the German fleet actually turned 18 points from southeast by east to west. When night hidden by the smoke-screen of its destroyers

Then followed the night action, for which also Jellieo has been bitterly criticized—and also warmly defended His critics claim that in view of his superiority in battleships he should have dashed in that night and fought lee action (for such, in the confusion of the night, it would have been) and sunk the whole German fle But Admiral Jellicoe thought otherwise Save he "The result of night actions between heavy ships must always be very largely a matter of chance Such an action must be fought at very close range, the decision depending on the course of events in the first few minutes The greater efficiency of the German searchlights and the greater number of torpedo tubes fitted in enemy ships. combined with his superiority in destroyers, would, I knew, give the Germans the opportunity of secring heavily at the commencement of such an action "

In view of the fact that there was no reserve of dread

### Engineering

Dock Gates of Reinforced Concrete.-Owing to the scarcity of timber and steel during the war, the gates for a private dry dock in England were made of rem-The dock is 40 feet wide and the gates They are circular in form and de are 14 feet deep the 14-foot head of water are only 31/2 inches thick No waterproofing compound was employed and yet they are said to be perfectly water-tight

Spray-Painting Corrugated Steel - The corrugated steel used for airplane hangars in this country and oversome was painted before shipment. Owing to the large quantity of steel, it was out of the question to do this work by hand and machines could not be used on account of the corrugations For this reason, a spray system of painting was employed First, the sheets were coated with red lead before being corrugated, and after that they received a coating of green on one side and gray on the nther side, applied by means of a jet 14 inches wide

Wooden Lath Natting - A povel material for house building has been developed in Norway A netting is employed, made of wooden laths 1ht laths are two meters long and eight millimeters square in section in roughly about fiths of an inch square. They are bound in a lattice form by means of tinned iron wire and applied to the wooden framing of the building. The netting is plastered with a mixture of sand lime and plaster of paris, or cement, sand and lime A number of buildings have been put up in this way and have proved very serviceable, even in severe winter weather

Oil vs Coal for Warships In a paper recently read before the Burlington Association of Mechanical Engineers, the advantages of oil fuel over coal for warshing were minmarized as follows | lor an equal bunker weight the radius of action is increased 50 per cent, and for an equal bunker space 50 per cent. Oil furnishes up to 83 per cent of thermal efficiency as against 50 per cent for coal Smoke can be controlled perfectly when it is desirable a donse amoke screen can be produced or the smoke can be entirely climinated With oil fuel, the boilers can be forced up to 50 per cent above their normal rating Oil fuel reduces the amount of labor by about 70 per cent There are constructional advantages in its use and ships can be bunkered at sea much more readily

Rolling Boilers 21 Miles -Over a year and a half ago, the passenger steamer 'Bear was wrecked along the coast of northern California and six 45-ton boilers worn salvaged from the wreck. It was planned to tow these boilers to Eureka, (al but after a number of attempts to do this had failed it was decided to roll the hollers along the heach for a distance of 21 nules to Humboldt Bay Lach boiler weighed 45 tons and was 12 feet in length and 13 8 feet in diameter. The work involved clearing a road along the rocky beach. In two places rivers had to be crossed At the Bear River crossing, the builers were rolled through a ford while at the Cel River crossing they were loaded on a barge and towed for two miles to a point where the rolling process could be continued. When the boilers reached Humboldt Bay, they were loaded on a barge and towed to the wharf in I ureka

Bearing Power of Piles in Clay Soil -A recent usue of the London Engineer quotes the following from a lecture given before the Society of Engineers Clay, containing a definite percentage of water, and at a definite temperature, has a definite pressure of fluidity. and when this pressure is reached and maintained, the clay yields indefinitely as a dense viscous fluid, unless it be restrained from flowing or caused to rise so as to produce a statual head of clay 1 or equal depths, tapered piles support a larger load per unit volume of the pile than piles having parallel sides, the reason being that as their surfaces keep in more intimate contact with the clay, the friction on their sides is greater For a given quantity of material of which to make piles a larger number of small piles as more efficient than a smaller number of larger ones Pointed piles are more efficient per unit volume than blunt ones, because the points cause a more gradual lateral displacement of the clay, thus leaving it in more intimate contact with the clay, these leaving it in more intimate contact what can add the piles. The residence of the piles The residence to penetration is of vora less immusises the general population to such considerably greater the lower the temperature of the an extent that the epidemic declines spontaneously, elsy, probably because the pressure of finite the spontaneously, the exhaustion or thinning out of infectable

Training Field Workers in Eugenics -- Director C B Davenport of the Eugenics Record Office on Long Island, assisted by Dr. H. O. Laughlin, has been giving every summer since 1910 a six-week training course for field workers in ougenics. The course comprises 25 lectures on human heredity and eugenics with special reference to conduct together with laboratory work on charting family pedigrees, tracing the descent and recombination of human traits in pedigrees statistical studies on variation in plants and animals studies in the elements of biometry, etc. ( linical studies are made at institutions for various types of the socially inadequate and field trips are made for the purpose of securing family pedigree records at first hand

Charles Brinkerhoff Richards, scientist and inventor and connected in a professorial capacity with the Department of Mechanical Engineering at Yak for the past 14 years died at New Haven on April 20th Professor Richards who was in his ciglity sixth year, was one of the last of the old school of technologists who were forced, in the absence of engineering or technical schools to hridge by their own efforts the gap between the theoretical subjects then offered at the colleges and the practical arts in which applications of these studies lies and that no such obstacle as this will keep a great engineer down was amply demonstruted in his case as in many others. Aside from his long connection with Yale Professor Richards was, perhaps best known as the inventor of the steam-engine indicator that hears his name and that has been termed the most important single factor in the development of the steam engine since the original inventions of Witt pioneer in the development of the platform walt ma chine for testing the strength of materials and was responsible for many advances in the field of heating and ventilation

Sex a Relative Condition - The claborate investigations of sex phenomens in various plants and annuals made by Dr A M Banta, under the ampices of the Carnegie Institution (Department of Experimental Evolution) lead that biologist to some interesting ideas which he sets down in a recent report of his department

We are roming he says "to the time when it would sem imperative to revise our ideas of the fixity of sex With the relativity of sex so emphatially shown in hybrid pigeous in hybrid moths, and in different species of Cladocera one wonders if the relativity of sex ends with pigeons gypey moths and witch flear There scoms every reason to think that it does it the phenomena of the crowing hen and the sitting the masculare woman and the efformate man as merely conspicuous examples of sex intergrades which refute the common conception of maleness and female ness as complete, opposed and mutually exclusive Indeed it is a reasonable supposition that is always relative—that while most sexual individuals of whatever species are prevailingly male or prevailingly female every individual may have something of the other sex interningled with the provailing sexual characters

Some Facts About Infantile Paralysis -- \ voluminous work setting forth the results of studies on poliomyclitis (infantile paralysis) in New York ( ity and the northeastern states during the year 1916 by Drs Lavinder Freeman and Frost, has been issued in Washington as Public Health Bulletin No. 91 The tentative conclusions reached by the authors are as fellows 1 Pohomyelitis is in nature, exclusively a human infection transmitted from person to person without the necessary intervention of a lower animal or insect host precise mechanism f transmission and ivenues of in fection being undetermined 2 Infection is far more prevalent than is ex dent from the merdence of charcally cognized cases, since a large majority of the persons infected become 'carriers' without clinical manifesta-It is probable that during an epidemic a very considerable proportion of the population become in-fected, adults as will as children 3 the unrecognised carriers and perhaps mild abortive cases are the most important agencies in disseminating infection 4 An demie of one to three recognized cases per thousand,

### Automobile

Combined Horn and I amp - I wo prominent men in the Lastern automobile trade have invented a combined horn and headlight for automobiles that is said to save material give adequate protection to the horn and at the same time provides for mounting the horn at a point where it is most effective or at the front of the our The construction worked out by the myentors is as follows. Near the roar of a haddlight. ( the usual bullet type and below the horizontal diameter of the lamp a hole is made, and the metal edges are turned up and This opening is slanted both downward and rearward to prevent rain beating in or the careless flooding of the lamp by the car washer. The ferrule is provided as the supporting member of the signaling device, as well as the mouth of the horn, as this is the aperture through which the warning sound finds egress mechanism of the signalling device may be any of the types now to common use. It is either made integral with or connected to the ferrule and fits snugly in the rear of the lamp in the space back of the reflector the vibrator type of harn, the hanne are not altered except for the making of the one hale the bulb arrangement is not disturbed and the wires of the horn are threaded through the tubular member of the lamp and its regular supporting post with the lighting leads. No other wires are required

Wick Oiling for Chassis Parts -For some time past automobile designers have sought to provide some simple form of automatic lubrication system for the usually neglected parts of the car chassis such as the spring bolts brake connections radius rad bolts spring shackles and other out of the way parts While oil is not an ideal labricant for heavily loaded slow moving bearing surfaces it has the advantage over grosse of being fed by capillary attraction while greas needs pressure to force it to the hearings and if this pressur is not appiled, the grease will not flow. The method employed is to cast or otherwise form oil reservoirs integral with the supporting bearings and to have a wick run from the oil through the hollow bolt in shaft that is to be Jubicoited The wick draws up oil constantly which is supplied the bearings by suital is drilled boles in bolt or shaft ally such a device is ant most; in action and as the reser voir may hold enough for several weeks operation the motorist is not called upon to give the oiling means frequent attention and the essential lubricating process is not apt to be neglected. As the parts thus oiled automatically are these that we ir out and make noise when the ear is operated any system that insures a regular supply of oil and consequent diminution of depreciation is worth while. It is believed that many of the new mod is will have some such automatic orling means for

Simple Gage for Measuring Compressions -- One if the most common causes of lost power in an automobile is that the force of the explosion pressure depends upon compression pressure before the gas is ignited. If the compression is 80 pounds the explosive force acting against the piston top and imparting power to it will be about 400 pounds per square inch. If worn piston rings or leaky valves allow gas to escape when the piston is rising on its compression stroke, the resulting decrease to 50 or 60 pounds means a reduction of explicate pressure to about 300 pounds per square such. Besides this diminution in pressure there is a loss due to further leakage t'irough the faulty retaining members \ \simple compression pressure indicating gage may be made by taking an old spark plug body from which the percelain has been removed and fit in a valve from a discorded onner tube by pouring melted babbit metal r solder in to fill the space between the spark plug shell and the valve When the metal has set the valve is found to be firmly imbedded in the soft metal. The spark plug is removed from the cylinder to be tested and the combination plug body and valve stop put in its place. As the country is turned over briskly by either the hand-crank or selfstarter by an assistant or the orgine run slowly on the other cylinders is tire pressure re ording gage held against the valve will record the compression pressure just as it does air pressure inside a fire If the pressure is low on all cylinders it is a good indication that the entire engine needs attention. You can determine whether the compression is adequate by comparison with

### America's Optical Emancipation

How a Dreamer of 66 Years' Standing Has Seen His Vision Realized

By Hugh A Smith

I a steep river road from the flats below trundles a U is steep river road from the nate below tundles as lead of carst loud large but in the industrial his cloth of carst loud large but in the industrial his cloth fact ive on the trials if the age-we re give it has supplianted the ocean liner and irrussilloute frighter turthering it furnals each it with a fitte solution. Turnierum et turnstes dati viin. I the solution of the mast dibent ent ent ent int in Morriean urgent warting ut dustress. I a the tricl is Luken with opti al gloss can ug the mest practice and bitherto muttamable of rise mut risks. When the problem of its manufacture was a catally a leed for the first

of its manifecture we set of tills a leed for the first time in More; a the chiminating chapter was settlen in the outsigned in the pit of industry from Germany tuttal a letter in recting to involve say optional glass. At he divise reducibly from ware variety we regard to some of the exclusive in histinal bertrages of a very few large nor contrast particularly for exclusive industrial hiritages of a very few fur pean countries particularly ter-many it was as of those industries shruded ir involvey whose secrets are handed of win from father to son in rehanked discussions lather to some re-stricted communities. Then the wared adds by ke in large and of a sudden ships could de king it. American parts with their cargoss of the foreign product. American ingeninty faced another of those raw material problems which must be solved if one of the country's most im-portant industries was to be maintained saved it one of the country's most rap-portant industries was t be maintained it was a crass in that industry which the government was quick to recognize and keenly so when America entered the way for without optical glass it could not obtun the range finders gun sights periscopes searchight mirrors photographic lones binoculars and other optical instruments, which it immediately called for and with out those instruments America's army and navy would have been but blinded forces in the practices of modern warfare

tores in the practices of montri warrare.

This condition is not one of recent growth When John J Bausch came to Rochester N Y in 1853 and by hanging a few pairs of house-made glasses or spectacles in the small front window of a cubbler's shop,

spet tactors in the small front window of a cumier's scope, founded what has grown into a great optical business he was compelled to make his spectacles with lines a imported from the old country. Optics was at that time imported from the old country. Optics was at that time almost an unknown science in America and its industrial application even more rare. Popular projudices decreate that everything optical must come out of Lurope Nevertheless the lenses which Furope delivered to young Bausch were se unsatisfactory to that exacting mechanic that he constructed the first lens granding machine in America and lugan to grind his own by hand one specimens of his superior product attracted the attention of New York opticians who straightway dis

covered the source and be supplied with any sur plus lenses which he might turn out As sons grow up and joined their father, the acope of the business was gradually various fields of higher optics contending at every step of the way against preterence Furois in products Ioday every type of optical instrument is proplant, which undoubtedly, an c the outbreak of the war, has come to be the largest optical manufactory in the world, not even excepting the wonderful establishments fostered and subsidised in the past by the German government

government
During all that development however this pioned establishment was compelled to depend upon Europe for its basic raw maternal, the opin all glass constituting its his blood. This condition disstantial its founder as much as had bis earlier deposit new upon Germany for voglass lenses. The matern it was satisfactory enough but the source was too remote, and the relationatip out of harmony with his other plans and purposes.

The special pottery where pets are made that will satisfy the exacting demands of ontical rises manufacture

In the development of his business Mr Bausch had ained to control all processes insofar as possible, having his own foundry, in which were cust metal parts for the has own foundry, in which were cust metal parts for the different instruments, and his arapenter and cabinet shops, in which all wooden parts and cases were produced in the plant, but all from the rough glass blanks origina-ting in Lurope Thus condition was so galling that often in the presence of his son, William he declared that he would give all ht possessed if he wer not compiled to look to Furope for this glass supply. Such statements influenced William Bassel is a early as 1903, to begin some secret experimenting on his own initiative in the

httle glass-pressing plant which had been erected in the preceding was on the Genesee River state behind the recording was on the Genesee River state behind the recording the first between the purpose of moding the behind the before grinding. His first attempt, its one of the small and wholly indequate pressing furnishess, proved most inauxplesous. Seeking a pure, white glass, he obtained. The sax of the job he was attacking may be inferred from a hund reference to the hattory of opioid glass from a hund reference to the hattory of opioid glass from a hund reference to the hattory of opioid glass of the world's formants optical securities, etaled that the future improvement of the microcope was an the hands of the glassmaker, implying that the optician had gone for the glassmaker, implying that the optician had gone after a he could in the development of precision optics with the glass then available in response to this appeal DF efloit, and had the control of the country of the co

This Jens glass, so-called, is marked by its absolutely clear transmission power and its freedom from all strain and strass, groung it an entirely even refractive index throughout. It is capable of heing cor-rected for both chromatic and spherocal aberration, which means that it can be made to transit perfectly accurate and colorless images to the eye, the photographic plate or the screen, as the case may be It is absolutely essential to the manufacture of optical prisms and achromanufacture of optical praises and accur-matic kines So exacting and difficult are its requirements that any pot which yields 20 per cent of usable glass after final inappection is considered very satisfactory. This results of come, in a high manu-facturing cost the list price of optical glass of the quality indicated ranging ever before wartime advances, from \$1 to nearly

Mr Bausch's early efforts to accomplish Arr Dausen's earry enters to accompuse a has purpose of producing this glass in America appeared so futtle that he practically abandoned the project for a number of years. Finally, in the apring of 1912 he attacked the matter by again entrasting his purchasing agent with the task of obtaining information. regarding equipment needed for optical glass manu-facture in Rochester At the same time he advertised facture in Rochester. At the same time he advertised in the trade papers for a glasmaker, in the vain hope that a lone member of that its, with optical glass experience, might have strayed to these shores. He was unable to find such a definitely transed arisan, but failly locate a young Beignan, Victor Martin, a glass-cutter by trade, whose father had been a glassmaker in Beignan Wilson Bauch ungged at his Beignam Than Beignan Wilson Bauch ungged at his

personal expense and at work on the river flats He also put an oilfiring furnace in a small shed

adjoining the pressing plant. With that equipment Martin began his expe early efforts more successful than had been ployer, and most of the year 1915 he spent in study-ing what works he could had on the subject

A pot of optical gians (right) after cooling for several days; note the clay cylinder pot. At the left is shown the same pot in assessment.

In the spring of 1914 he designed and built another oil-firing furnace but was unable to hold the required temperature with it The city gas as then applied, proved to be an equally unsatisfactory source of heat, and efforts were practically suspended until after the war started in Europe in the late summer of that year Then the importation of glass speedily became difficult nd uncertain All of this most important maternal that the company could count on for its future operations was the surplus stock which

the surplus steeds where it is chanced to have in its vaults at the time

The other members of the company accordingly same definitely interested in the problem, and in the winter of 1914-15 a second building was erected on the river flats, containing two gas-firing furnaces and one potarch, or smaller furnace, which is used for the preliminary beating of the pots The work could now be undertaken

heating of the pots. The work could now he on a larger and much more effective scale for, with the knowledge of theory and formulae already acquired, successful pro-duction was largely a matter of persistent experiment and repeated effort. The first melt of barium crown glass in May, 191) came out purple and was not usable. In the third melt of the same month however some light crown and dense fint glass were produced, which were usable. During the following month light fint was also successfully produced and experiments were begun on most of the other types in more common use

common use
Thus after three years of labor, more
disheartening than can be indicated here
following several other years of dreams the
victory had been won and another Furopean victory and need won and another Furopean monopoly, an exceptionally tenacious one, had been broken No boastful announcements were made however, as the pioneer producers wished to be absolutely sure of their ground before taking the public into their confidence In the early summer of 1916 specimens of several different types of optical glass were displayed at the national conventions of the American Medical Association and the American Optical Association in order to allay the somewhat panicky fears of the trade profession at large

the winter of 1916-17 the plant produced glass which was used in the manufacture of several hundred high-priced anastigmat photographic lenses, hitherto employing only the highest grade Jona glass Those employing only the highest grade vone gass. These lenses were fitted to speed cameras and subjected to the most exacting tests. In subsequently congratulating the plant on its achieve-

ment the camers manu facturer wrote "Our critical tests of these lenses show them to be not only equal, but superior to the same type of lenses hereto-fore made from imfore made from ported glass "

ported glass"
When America en-tered the war in April, 1917, one of the first objects of the govern-ment's concern was the supply of optical glass. The authorities made a survey of the attention and found that of the ral establishments at that time contending with the problem, the plant which William Bausch had fathered in

Taking a pot of glass from the furnace. The pot is really almost white hot, but looks dark in the glars from the furnace, whose temperature is about 2500 degrees Fahrenheit

the Camegic Institution, at Washington D ( which had been turned over to the givernment at the outbreak of the war accordingly established a research laboratory at the Rochester factory, at the suggestion of the Council of National Defense. The Complexical Laboratory was headed at that time by Arthur I Day, Ph D who de

Three of the many pressing furnaces in which the small pieces of finished glass are fashioned into approximate form

tailed Major I E Wright, Ph D at that time a civilina, to take charge of work at Rochester
The government laboratory came to Rochester in the spring of 1917 with a staff of six mn — I he chief difficulty up to that time had been in the low transmission power of the glass produced. The government workers were

instrumental in obtain ing purer raw materials which this difficulty was largely covercome and it then became simply a case of trying out different methods of stirring and temperature luce glass of the highest quality

Meanwhile the glass plant was materially en rged by the erection of additional plant and buildings until today it is one of the largest optical glass plants in the world It employs when running full force about 500 hands and contains besides ax single pot arches eigh teen double-pot arches ind one stone arch tive

single-pot melting furnaces three double-pot melting furnaces and one 16-pot melting furnace with a total capacity of about 116 pots a month. When the plant is operating at full capacity, it consumes more than 33,000,000 feet of gas per month or an amount equal to the total monthly consumption of a city of 60,000 inhabitants

Of the different types of optical glass hight crown bore sheate crown barum crown light flint dense flint and silicate cr wn (the last named for ophthalmic are being prished of a quality lemas are being praduced of a quality equal temp previous obtimed from Europe while experiments on other types are constantly being indicated. He ex-tent to which the praduction has been placed on a practical and permanent basis is indicated by the fact that when the arimstice was signed enough finaled American glass had been placed in the vaults to list the company several years under normal operating conditions

I arly in the development of this activity difficulty was experienced in obtaining suitable clay pots for melting the glass at the tremendous temperature required American potteries had never before been called upon to meet such exacting require ments. In using the best pots obtainable ingredients from the pot would too often ingredients from the pot would too often mingle with the incitru mass and spoil the resulting product—this difficulty was finally overcome by building a pottery alongside the glass plant engaging a technically trained expert in teramics and making on the spot pots especially de-signed for their specific uses seens of optical glass manufacture are fas

consting and more or less spectacular. The pot a heavy, consting and more or tess spectual unstaining of a neary, oylindrical vessel of superior class open at the top and measuring from 25 to 36 inches in diameter according to the requirement is brought from the storeroom of the pot house and placed in the pot-arch for preliminary

heating which takes four or five days. When it reaches a temperature of about 1 800° F, it is transferred to the melting furnace which has been heated meanwhile to the same degree and the temperature of this furnace is brought up to the melting p int of according to the type of glass to be melted

Then the raw ingre-dients which have been previously mixed as cerbing to established tim dae are filled in the pot at intervals ingredients em placed depend upon the kind of glass desired. They are essentially the oxides carbonates and nitrates of certain in tale of arsens and borax etc. A glass containing (Continued on page 469)

Reference was made a moment age to the damage to land it is at fir t glance not easy to see how earth is lo be damaged. But consider the most superional damage of all the putting in place of barked wire entanglements. One thinks at home of barb wire is a httle fence set up between trenches in No Min's Land Then ne course

No Min s land Then necoures Cover here and sees the fact index and unles endless miles of birbed wire not in orderly fences but in twisted masses and libes miles and miles are not only in length but in depth. Behind the Verdun bettleonly in length, but in depth—Behind the Verduii battle-fields where the German Lifth Army was stationed for so long, there is enough Little dwire in position to require mother ax months bombardment to remove

There can be no filling of the soil until it is removed a long slow tedious process, involving the expenditure fundinons in Liber to cut, to drug to bart cd sire graves—
else the expenditure of precious years watting for
nature and riset to remove this hideous wart on a fair
hin. One piles sebarled were from orderly rolle quickly—
sily. One displaces it by blowing it to late or
ly drived bean labst during peace, and the birthed
sire duringe is the least which has been done to the

The barbed wire publications have some unexpected lutions I anks have I on used to drag it from the find with great success. In lod in more than one American action tanks hooked in to barbed wire entanglem at and literally pulled it from the earth for a quarter

in nes and interany patient it from the earth for a quarter it finds, it for troops go through It should in take a very great amount of ingrining it produce a mechan with heavy follers not prinaise insumiter to a rock crusher into which this mass of wire and piles might be fed and which would turn out at the other end an endless rod of wire and crushed wood of varying dismeler according to the amount of wire. This tangled mass compacted by the machine could be chopped into lengths and those lengths used for reinforcements in poured concrete work put forward to the writer by a solder sugmeer, may be but one of ode as a snyone of which might aid in the barbed wire problem. But whatever method is used it must be ware problem. But whatever method as used it must be a new and an ingenious one, and it will take money and machinery and initiative. Whether I rance has any allow time to be a factor, she has not said and certainly the present a rube will not stand and certainly the present are will not allow the method to the like great damage to land has some from intensative shell time. Whill which exploits broath the surface

of land churns it up buries the top soil and brings earth to the top which will not grow even a weed. The inerc to our top white will not grow even a weed. The inerce
physical disturbance of the land, the making of a tillable
field into a series of hillocks and holes is bad chough, but
even if leveled off, such fields are still worthless, since even if leveled on, such fields are still wormness, since years must clapse before the soil again becomes fit to grow crops. Of 8 000 square miles in German hands in May of last year 6 000 square miles were tillable for crops and most of the rist fit for his and maximage. It and most of the rest fife for his and pasturage to river as some of the fifth for his and pasturage to represent a some of the finest agricultural land in leastful France. Ten lavaded dypartments in 1915 produced \$400 000 000 in crops. Here regume are prilaps 15 pre end of the tillable area of I rance and produce 20 per cent of her crops supporting 800 000 people or 10 per cent of the working agricultural population of I rance All this, of surse, is history
The land is idle now and will be for some time to come
and a quarter of a million acros of it will not be cultivated

Chateau Thierry after the Germans had retreated, July 27, 1918

sgain fir many many years, unless size use finds a way of turning bottom six its top!

There are thousands of sad mints of de-troyed woods One wanders through the Argonic forest or what was the forest, one, and satches one a breath at what the Americans did there. But one railra too at what so call trans the Argonic forest is a nume. The trees are but stumps Shell fire does to a wood that which must be seen to be understood. A western forest fire is far disastrous, since it, at least does nothing to the

Ibink of 250 000 little farms all idle! Think of \$80) 000 000 of farm land, unproductive. Think of the \$80) 909 000 of farm land, unproductive. Think of the mare ultimal instruments deserved and richne, which must be replaced 50,000 and hill ploughs, \$3 000 other ploughs \$50 000 cultivations 90 000 movem ganchinas, 115 000 firm wagons, \$8,000 harrows 50 000 plous 30 000 seed stills, 1500 fertilater persident fo 000 hert cultrations, 21,000 movement, such as the production of the cultration of the production of the productio

in dollars is much like estimating in dollars for human life destroyed. The wife who receives \$19,000 insurance when her husband dice has a fence raised between her and poverty, but does she consider herself paid? Germany may pay to the last dollar for the damage done to leave but destructs but as

many may pay to the last dollar for the damage done to I rench industry, but can any payment ever compensate for the time the product, the effort wasted? But again one confront figures and dollars as the only available pigments with which to aketch the run. So one starts with 20,000,000 of dollars destroyed in the coal regions, and tires to understand what it means when it is said that 70 per cent of France s best coal produced in her own lands, same from the invaded regions and that 100 000 fersoloment on the first which were for 140 000 Frenchman worked in coal fields which were for years in German hands. Three quarters of a million people depended on the coal mines for a living, and while propie deptation on the road makes for a living, and white France has her mines again getting them under produc-tion once more and rehousing the minera and their families is a task which may take years. Half a billion dollars worth of machinery in 100 and steel mills are destroyed or takin 100 Germany Ope

hundred and twenty milions of damage was done the toxtale industry. There were 210 sugar refineres in textale industry There were 210 sugar refineries I rance in 1914 Now there are 70 Is it any wone that the san harme bottle is a commonplace in the French restaurant the sugar bowl an unknown dush?
Of 3,000 brush factories two-thirds are damplished Of 3,000 brush factories two-churds are damoussies.
Fifty millions in electric power statuous are gone, producing 300 C00 k w, and that power is needed now Breweries have lot \$22,000,000,\$100,000 000 on small machine shops has

been ravaged to fill Hun factories or Staty millions may and may not cover the foundries loss, and none of these figures cover land or buildings Moreover machinery is three times as expensive today as it was four years I rance calls her machinery bill for destroyed or stolen engines of

industry \$4,000 000 000

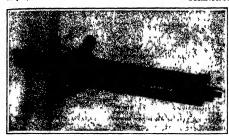

And \$\text{st}\$ one might run on for pages
Twolve hundred thousends acres of
furest destroyed Output of coment
now badly needed, reduced from
3 000 00X to 400,000 tons a year Ten
per cent of her lumber, \$\frac{1}{2}\$ per cent
of her firewood are gone One wanper cult of the furnishing of the firmwood are gone. One wan-ders through a soa of statustics and wonders which is the ruddiest in color, the most flaming in horror. One statistician with an imagination has calculated that if I rance could put 500 000 building tradespeople to w and for 20 years they did nothing but rebuild and repair the damage of war without starting a single new project, France might look, in 1939, as she did in 19141

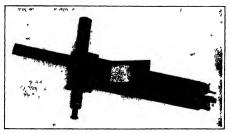

did in 1914!

The total physical damage is estimated as some \$13,000,000,000. The human mind does not compresend 1,000,000,000 area as a name. One cannot adequately realize 1,000,000 let alone 13,000,000 0001. This, then a the problem, murely the physical aspect of the problem, which Franco faces. That she must still maistain her army, look after her army of occupation, conduct her business and her government, take case of our vounced and her refusees, find work for her helplass have a supplied to the control of the control o tackled her 1 beith the same high courage which made the blue coated sidders invincible at Verdun One looks in vain

hissociated singless invincines at vertur. Onclocks in vain for any expression of discoveragement, of fear, of anniety. The Hiss is out of France: The future is before her The great fact of the present is that the war is over and that be the problem of the days to come what it may in difficulty, it cannot possibly be so had as that of the years when no man knew whether peace would come with victory, or with annihilation—it was never thought by any that it could come with defeat

Cattle have dummabed in these regions by over 50 per cant. The loss in wheat is 1 90 000 serves in hay 80 000 serves in heap 80 000 serves. Although the serves of the serves

The visibility mater ready for action

### Increasing Visibility Through a Knowledge of Camouflage

Suggestion of Permanent Peace-Time Value Drawn from the Efforts to Make Ships Invisible By Robert G Skerrett

I T may be said without fear of contradiction that we have shifted marine camouflage from the field of a A nave sauted marine canonings from the netto or a debatable act to the realin of scenee . In doing the we have settled a number of vaning questions and we have achieved results that are likely to be of the highest value in the days of peace. This may sound paradoxical but it is only proof that principles when thoroughly under stood, are susceptible of application in radically different

The public has already been told of some of the results obtained by us in seeking to develop systems of protective coloring for our shipping systems that would either induce a notable degree of low visibility at gunfire ranges induce a notable degree of low visibility at gunther ranges or mislead the man at the priscope through the effect of dassis." or confusion After we had been somewhat as war with Germany we were still groping an our efforts to evolve a really natisfactory order of marrier camouflage. The constituted Folorial authentiess actually approved five mer. or less radically disamples are system—the products of five New York ratists who had tackled the problem from as many different angles. In a very large measure their essays were essentially empiri-cal, and each was pardonably certain that his was the

We should probably have gone on guessing just as our Allies abroad did throughout the war in this department of deception had the question not been attacked by the Submarine Defense Association and through it analysed and investigated in an exhaustively techni al manner The Submarine Defense Association was called into being by something like a hundred steamship companies marine underwriters and others interested in nautical matters, and its primary object was to devise ways and means for either dodging the U-boat or minimising the effectiveness of its offensive weapons Naturally marine camouflage was one of these and the association realised that the selection of the protective coloring that wanted that the selection of the left to personal opinion
It was perfectly plain that some scientific basis of com
partion had to be established and agencies developed
where none existed that would evaluate with precision

paraon had to be established and agencies daveloped where none existed that would variate with precision the relative turnits of rival camoufflage designs or methods to put it popularly, the comparing camoufflage was all from Missouri, and, what is more to the polat, it was accessary to mice them, seek for Int. On the polat, it was accessary to mice them, seek for Int. On the polat, it was consumed to the control of the following the committee of the Bulmarian Defense Association secured the cooperation of a herge ensure when seek of the polatic properties of the Superaction of the Engagement shorestory and the services of its eminent experts in high, tooler and optics. The whole story of what followed is a fascinating one, but cannot be told now. The finisher of the commendate interest is an instrument, investedly and perfected by Linyt A. The appearation in question is the visability and the Mcditernants are probably was also affected by the proposition of a column value in the control of the column value is a superior probability of the column value of the column value of the column value in the column value of the co

will stand out in vivid contrast against a liminous sky background but that a ship moving away from the source of light and toward to roppen to part of the horison becomes varyingly wail is not by reason of the background but because of the amount of light which its surfaces reflect and the intensity of the chied was east by various features Therefore the aim of the camoufleur is to reduce this reflection value and t ) promote an appearance of flatness by brightening up the shaded areas through the employment of white light blues and grays II is a matter of knowledge among technicists that areas of pink violet and green will melt into a uniform gray at a suitable distance, and that this gray will be either warm or cold according to the preduminance of the pink or the two opposing colors violet and green. On the other hand a gray can be produced by a similar merging of areas of white, blue and gray with portions of black. These suitably varied in their pr p rtions yield grays of low visibility admirably suited to the anditions imposed

The man in the street will probal ly want to know just the man is the steed will probably want to know just how the scientists of the Visionarius Delenek-8s (1) thou rhose the contings finally adopted -Oinega gray and Psi gray In abserving the sky grays characterist to the two sections into which they divided the submarine danger are it was noticed that the klasses or perisopes employed for this purpose allowed promistic Ohrs.

When this glare is stall bent strength to shut out the object or t make it seem to merge with the lack ground then the redding of the instrument gives a true measure of the visibility of the model when yie well assembly in the novaling ladds to optically a second to the novaling ladds to optical.

normally in the prevailing light conditions

A careful analysis of weather reports covering the region in which the majority of the ships were sunk by submarines revealed that 70 per cent of the days wer loudy and from this data the scientists of the Sub-marine Defense Association determined upon a reflecting marine Designe Association determined upon a reflecting power of 45 as a weather factor that had generally to be considered in meeting the requirements of 1 w visibility. This point is of interest because it bears directly upon the relative monts of the products of actual camonificurs and relative morte or the products or actust camounters and the cubres and syndings at the dupon by the accurate of the Assonation. The accompanying table is based on analyses of computing designs which were tested by the visibility inster. Models 1 20 and 1 F 9 wags prepared by the Assonation and Molles 1 20 and 1 F 9 wags prepared by the Assonation and Molles 1 20. show the extrema degree of visibility obtained through the employment of a uniform coat of black

Invasibility is represented by zero and the visibility of the various models was rated as if they were viewed at a distance of 6 000 yards. Omega grav developed for the northern dauger some has even a lower visibility than that understed by Models 19 and 120. The U.S.S. Germ which was used by the Association for experimental purposes showed a visibility as low as 0.2 in clear weather at 1500 yards and was invusible at a

th thear weather at 1 does yourself the same of 3000 yards.

The layman will probably ask Of what possible peacetime uso is all of this scientific work and research. (Continued on page 471)

Three views of the Bolrauli tank, showing how the hexagonal framework is operated so as to lay rails for the engine-bearing member in the center

### The Invention That Won the War

### How the Tank Idea Was Conceived and Progressively Worked Out

THIS is a story. In wonderful ides which was progvention probled by the war. Indied which besiding in wention probled by the war. Indied which besides on and that brights of or the winning of the great war the leading authorities and studies of the strangel have at least at said these immedied than by starting in clear unmostanded language that this great Whird invarian the tank was the dreamy factor in the fundam analysis. If the skillable intrinsic held carranges

must some the transmitted at the vertex. The tank of a regularded at the vertex days of 1914 who is the Germans swept over I rance and belgum met differ at the Marne and islical lack some distance only to intrine in themselves behind containing belts of birthed ware. Then the British and I runk treef to break the might the barbed wire and the German trinds were a made with a different cost in blood and treasure. The Germans realized the diffusive value of turbed wire backed up by machine gun underficher. In fact, they halded millions of strong well trained Russians who rolled on up to the backed up by machine gun underficher. In fact, they halded millions of strong well trained Russians who rolled on up to the backed up by machine gun underfichen and the development of the discussion of the strong well trained Russians who rolled on up to the backed with the defenses in the national to be along the related to the tree of fenomes.

Thus the inventors set to work to find some way of getting at the German mas hone gunners behind their barbed wire balts. While intense shell-fire served to cut up the barbed wire, it was a crind measure at best Days of bombardment were necessary before a dense defense could be reduced and by that time the enemy had ample opportunity to make such dispositions as he thought necessary to must be imprending attack. Obviously, some quicker and inore efficient method was necessary some in the world return the vitally

important dement of airprise for an important state of a November 1914 a French instant of L. Breton, forwarded a plan to the French Minister of War, covering an armord automobile togoe driving a circular saw for cutting through barbed wires and their supports a formation of investments an innominally appreciated the military possibilities of this idea, and encurraged the investor to go should with a model. In January 1915 experiments were carried on with the type of machine about in one. It is accompanying

By an ingenious arrangement of track sections and steel cable, inventors sought

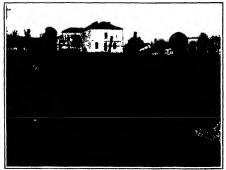

illustrations consisting of a six-hoise power gaseline engine driving a circular saw held at the extremity of a privoted arm which could be enquised so as to bring the saw to bear at any angle or beight. While the experimental machine was mounted on a simple factory trunk the actual military machine would have been mounted on an armored ear driven by the same or a separate engine. But the inventor and military authorities snow came to the conclusion that the metry tank would have to be more powerful and in easting about for a suitable vehicle they came upon the familiar

agructivate tractor with continuous exterpillar belix. At that time, however, it was impossible to secure an agricultural tractor although M Breton and Major Bosson of the technical socion of the Fruesh engineers, realised that an American tractor was the ideal mount Sot twas finally with a Bagui tractor, placed at their disposal by the end of February 1915 that the experimenters conducted their tests Mounted at the rear of the Baine tractor was a powerful set of shears, degreed by M results of the second of the se

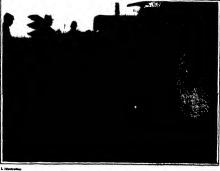

intended to saw the wooden supports of the barbed were a few inches above, the ground. Obviously the tractor was oper acted backs are in order to bring its estimage normbers into action. The shears worked larrly will but the saw performed some absolute of the same and the same action of the same a

while caused the Iranch army to order the first 10 caterpillar tanks of the Schendist-Crusest type on December 7th 1915.

Meanwhile other Iranch inventors were at work, notably Mesers Turnol Irot and Laffy, who followed out the idea of utilizing the usual road roller for the flattening out of barbod wire estanglements. In the state of the Engineers of the French army could be a supposed with a colored process of the French army couldness of the Fr

Barbed wire cutting member of the Breton-Protet machine, with the horizonte

three machine guns and was intended for a crew of terror ascume game and was intention to a view eight men—two mechanics, a commander and six fighters. When it came to getting over the battlefield and through barbed wire, the tank was not a success. In the first place, it could not operate over rough ground and over terrain which happened to be boggy secondly, it only crushed down the barbed wire which, after the passing of the tank, again rose in place to impede the

passing of the teat, again rose in place of impate in infantry waves
Another interesting ancestor of the tank was the machine of M Borrault which was examined by the French army authorities during the latter part of 1914 Resentially M. Bornuit's tunk, which is shown in one of the accompanying groups of illustrations consisted of an iron structure carrying an 80 horse-power gasoline engine. The power plant through a set of endless chains served to drive a set of pinious which in turn operated the power-carrying member along the track laid down by the hexagonal from

work I hus cash articulated acction of the hessagonal framework was laid down in its proper turn on the ground, and the powerearing unit rolled along on the short soctions of track, just as the aterpillar tank lays down a tinuous track for the body of the machine Barbed wire entangle-ments and shell holes and trenches were found to he readily spanned by this novel contrivance which which 28 feet in length, and weighted about 40 tens. It had a speed of about two miles an hour

In a series of experiments this novel tank proved quite practical for getting across buttlefields, but it failed of acceptance because it This objection was overcome applying a screw jack so that one side could be raised free of the ground so as to apply the driving power on the other side Still this procedure required too much and again, the tank was difficult to arm and still more

The technical section of the with the arming and armoring of agricultural tractors of the hitz type, which were equipped with an inclined cutting member for hacking a way through barbed win Driven by a 45-horse power engine these tanks were capable of 7 to 9 miles an hour in either direction In all, 10 such tanks were constructed, each armed with a single machine gun Against taut wire. machine gun Against taut wire, these tanks functioned pretty well, but when it came to slack wire they were of little value During August, 1915, they were sent to the 4th and 10th French armos for use against the enemy On being tried near the battlefield, however, they proved unable to cover the rough terrain and were returned to the rear before the enemy ever new them

Still another attempt at the sudden destruction of barbed wire was the electric torpedo of Messis Gabet and Aubriot, which was intended for the transportation of some 200 to 400 pounds of high

explosive to some suitable point in the enemy s barbed wire, which could then be blasted at the desired moment. triple caterpillar belts, driven by an electric motor Power for the electric motor was conveyed through a special cable which was automatically laid as the diminu-tive tank traversed the hattlefield

In November, 1915, M Gabet constructed an almore

in November, 1915, M. Gabet constructed an at mored celectic state, earrying either a machine gun or a 14-sinch quiek feer, with a crew of two mon 1 he electric power was supplied through a cable lawrestons are prollife people and never was this better linearised than in the earrying out of the tank idea. ### How Long the Oil Will Last

As an interesting sequel to the recent discussion of the probable duration of the coal supply for the world as a whole and for certain countries individually we present this week a series of graphical comparisons got up by our British contemporary the Illustrated London ens with regard to the oil situation. There has been wholesale discussion of this matter and the opinions expressed have varied widely—the particular period gned to the world's petroleum supply by any one assgared to the world a ptitoleum supply by an one authority being cordinarity, a function of the faith placed by that suthority in abade oil. He rick which shale, oil steeplay must of course eventually be a considerable one but just how considerable and just how eventually no no one todax on very well say. A cordinary the virtual who due the puttures which we reproduce appears to have been under metriculous, by agone is allogether. and to make his metures talk ab it untural oil from well-

from service to the overlasting benefit of the oil supply and the commercial user thereof. So it seems commently reasonable that the compiler of these figures be repr sented by m and of a large question mark the length of time during which the world will still have oil to bare We cannot help commenting unitered by up in the period which has been assumed by way of comparison

period which has deen assigned to water it comparison to the American cold indistry. As we ignited but in our recent the cassion of cold the figure 4000 cs indical the quotent of visible resources by present annual con-sumption. But our consumption to declaration rease with samption and our ross is a strationary say as w leplete them by use Incle I the exit related between vesible resources and consultably vesible. r sources is still a very op it opi sti Can we affor i to use pritty much all the cold that the trealogical Survey tells us the ground centums or can we bring ! the suface ally a small fraction thereof at pures withou

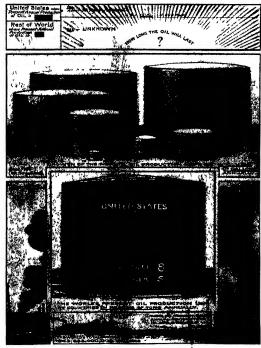

the reach of the manufactor rand the householder? On this point n find a conflict of authorities and a conflict so sharp that while one person who ought to know what he is talking about suggests 1 500 years as the period during which we shall be funneially com-petent to burn coal another gentleman of equal standing in sists that during the life of the present generation of adults our it is concerned. But in any event we shall not have coal for 1 000 years unless engineering triumplis structs and a service and a service undreamed of provide sub-stitutes for much of that now burned of ways of stretching the supply out to an amazing degreof longness and thinness

If the United States is the world s greatest producer of solid fuel it holds the same position with regard to the liquid combustible. But where China has coal re-sources which if developable and developed will make ourselook like i plugged nickel this does not ap pear to be the case with oilother region of the world are the present his producers and as far as can be forescen we are the big producers of whatever of future the petroleum industry may be destined to enjoy.
To any question which may be

asked bearing upon the reason why exhaustion a ready suswer is offered by the course of past con sumption and the extent to which it has depleted the petroleum resources Starting from infinitesimal proportions in 1857 oil production and consumption grew like a huge snowball—grew in a interest law completely shade so far as any such beggarly rate as six per cent is concerned.
Of course when we start from nothing or from next to nothing to build up a thriving I usiness wi expect to see colossal rates of increase be use something is bound to be a large percentage of nothing, so we is clust be startled when we not that from 1860 to

1870 the p to learn consumption increased about 1 100 per cost and from 1870 to 1880 about 500 per cent. But by such mercases the industry
was placed on a very sulstantial basis, so it does afford food for Hought when we are told that during every decade from 1880 to 1910 the ainual consumption of liquid fuel was at least doubled so that in 1910 it was more than eight times what it was in 1880. And since 1910 it has more sed about in the sum ratio so th normal course seems to be represented by a doubling overy 10 years

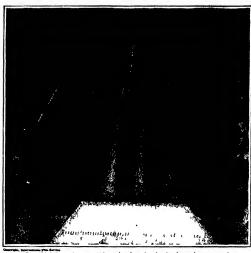

What this means to the customer is obvious enough what this diffulls to the engine is obvious clough Are we going to have eight free is much oil to burn in 1950 us in 1920 I in this ills we are not We should be singularly fortunate if it turned out that w were to have at that 11 17 000 000 000 g Hz to burn in the sem saide is in 1917. This is where the punch cames. If a simption were the sem from you (Continued on page 4"1)

The source, extent, and probable duration of the world's annual petréleum supply, as pictured by the Hiustrated London News

exclusively, the period allowed for the complete ex-haustion of the American supply is just about equal to that ordinarily cited for the probable life of our oil

If the United States has oil wells to last 30 years, it is confessed that he corresponding figure for the entire world is an unknown quantity. On a basis of previous rformance, it would appear that the world a supply cannot last appreciably longer than that of the United States since it is clear from mother section of the diagram that we are at present producing something like 71 per cent of all the oil that is taken out of the earth like 71 per cent of all the off that is taken out of the earth Yet the Mexican production and the possibility of here tolors undeveloped fields are such complete engines tolero didevisione and a place in point them and we have even hand the miggestion seriously advanced that the Langue of Estimate would work as well that a wast fiter of obtaining war ersit could be permanently retrod

they all succeeded in actting back to port for repairs. The "Idaho is 024 feet in length 97½ feet broad, has a maximum draft of 31 feet, a normal displacement of 32 000 tons and a full-load displacement of 32,000 tons and a full-load displacement of 33,000 tons.

Her beit armor is 14 inches thick and in decreasing thickness is carried up to the main deck. She has 18 inches on the portplate of her three-gun turrets, and 18 inches on the conning tower. She is driven he Paraune turbines operating outformant. Her speed at full power is 21 knots. Ih boilers are oil fired and the ship can stow in her double bottom over 3 000 tons of oil fuel

### Homing Pigeons for Forest Fire Protection

Protection

THE State of Minnesota and the Canadian government have adopted the system of Huming Pigeno Communication devised by Philip F Edelman, D.E. for Forest Lire Protection This system provides reliable communication under conditions impossible to wire and wireless methods in wild countries. In a given area, a house next is established at head carry two hirds in a speedl carrier on their back, or kit, or in their canade. If american, a color good of the carry two hirds in a speedl carrier on their back, or kit, or in their canade. If american a second to the carrier of the carrier of the carrier of the carrier of the second bird with check mossage to issure delivery. The weight to be carried is thus less than any fig deed the beneditation to which they have been trained, at about 60 man per hour, where 15 man and 15 min and 15 mi

### The Most Powerful Gun in

In the continual race between gun and armor, the gun easily main-tains its land. Even the 11-inch and tams its land. Even the 11-men and 12-insh guins of the German fleet found no difficulty in penetrating the armor of the British ships, and it is only because the heavier British projectiles carried a defective delay-action fuse that they failed to get through the heavier German armor in thew of this superiority of the gun, it may seem surprising, at first thought, that the size and power of heavy artillery has been increasing during the war at such a surprising rate

following table showing the continual enlargement of calibers and corresponding morease in the weight of projectiles, shows the extent of this development at a glance During the past decade we have seen the heavy guns of battleships and battle-cruisers

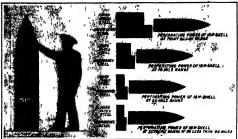

guns of Dattleships and Dattle-crussers grow from the 12-inch quin throwing an 850-pound shell, to the British 18-inch gun throwing a veritable monster weighing 3,600 pounds—an increase of 50 per cent in caliber and about 450 per cent in the

| TABLE SHOWING INCREASING BIZE OF GUNS |                 |  |

According to Sir Robert Haddeld, who specialises in the manufacture of amon-percept shell, the 3,000-pound properties of the two 18-neth guns which were first mounted on the battle-cruser Furnous and later on one of the British monitors are by far the heaviest amon-plexing abelies were fired. The gun, according to Engineering, waspin about 100 tons, and at its maximum elevation of 45 degrees it can throw its projectle which is 18 inches in diameter and 7 feet in length, to a distance of about 50.000 yards, or say 30 miles. In the trials of the gun, the shell, fired at a velocity equivalent to a range of about 11 miles, perforated a hard-faced plate 18 inches thick, which means that at that range which exceeds, by many miles, the most extreme battle ranges of the late war, it would pass through the heaviest armor affects. According to Sir Robert Hadfield, who specialises in affoat

The perforating power of the shell is shown graphic ally in the accompanying engraving from which it will be seen that at point-blank range the shell would pass through 41 inches of face-hardened armor which is through 41 inches of ince-hardened armor which is equivalent to a mass of steel 54 inches in thickness At 10 and 20 miles respectively, it would perforate 22 inches and 12½ inches of face-hardened armor, and at the extreme range of 10 miles, it would get through nearly 12 inches of face hardened armor

Now, if, in this high shell the proportion of weight of high-explosive filler to weight of shell is 15 per cent, it would mean that when the shell burst within a ship over 3,003 pounds of steel would be hurled in every direction

The shells of the British 18-inch naval gun—the most powerful weapon in existence Used against Zebrugge

under the hursting energy of about 500 pounds of high

Supposite

But how can a sabip be bit at such distant ranges
where she would be bull down to the ship that was firing?
The answer is to be found in the modern naval method of directing the gun-fire by sirplanes launched from the ting the fall of the shells would send the results back to the firing ship. At these ranges shells would full at a very steep angle, and the problem that is worrying the naval constructor today is how in the mains of the impossible is he going to provide sufficient deck armor to keep the shells out. It begins to look as though the only defence of the future will be high speed and the steering of the attacked vessel on a continuously singous course

Testing Automobile Tires on a Factory Roof OC VII D on the roof of a large factory building in Deuver Colo, as a most novel track and mechan am for the testing of automobile trees which has been made the subject of the cover illustrate in of this issue

As will be noted in the accompanying illustration this track and mechanism is arringed to simulate the this track and mechanism is tringed to similate the average conditions encountered by an automobile. The tire is attached to the free end of a pivoted aris and is driven over the track by means of an electric motor. surven over the track by means of an electric motor Switches and rheostate are provided for controlling the driving motor while a standard spee dometer gives the total milesge and speed. It track or 'road is quite a composite affair, part of it consists of loos rock, another of loose paving blocks still another riprism is a railroad crossing, and so on to simulate very kind of road over the best animal control of the contr a railroad crossing, and so on to simulate very sine of road over which a pneumatic tire is expected to travel. In fact part of the track is arranged as a double incline so as to give the effect of grades. Whirling about this so as to give the effect of grades. Whirling about this bigging directly read the tire receives a thorough test and nat 1000 5,000 or any number of inites traveled it is possible to determine the extent of we ir and tear

### Shell Shock or Neurosia

THE Medical Department of the United States Army has found that the early conclusions regarding shell ock are not true. There is really no such thing as shock are not true

shell shock although there are many cases of war acurosis. War neurosis really not different from neurosi found beyond the war rone

Neurosus whether found in the Army or among civilians is a subor scious desire and the physical condition induced thereby to avoid a his comfort. In the Army it is a sub-consecus desire to get to or to remain at the icar. However it does not proceedly f llow that the patient is lacking in ourage for there are many cases f war neurosis induced by the mental attitude of the patient concerning promotions leave alleged favoritism etc. Among officers neurosis is often induced by the respensi-bility occasioned by the demands at

Investigation has shown that shell shock or neurosis is unheard of among prisoners although they may be in feirful physical or mental condition just as it is almost unheard of among wounded excepting those who are

shout to be returned to their commands

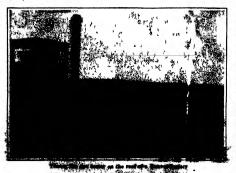

Finplies should be led in the fact that shell shock or neur sas is a sub cor seems attitude and a disease which must be cared. Here are comparatively few cases of patients faking

Many soldiers having neurosis will remain uncured even after returning to civil life unless the disease is thoroughly understood so that proper treatment may be given

### From England to India by Airplane

TTH the arrival in Calcutta on December 18th VV last of a Hundley Page airplane the first speek The landing of the huge biplane on the race course in Calcutta was witnessed by the Viceroy and I ady Chelins ford the governor of Bengal and an immense crowd of Europeans and natives to whom the second appearance of an airplane in ( alcutta was a great attraction of an arrivage in the deduction was a great average of the trip was made with all strings inshalp via kgypt and Mesopotamia a distance of about 6.700 miles by the route followed. An average speed of 85 miles an hour route followed. An average speed of 85 miles an hour was maintained and main stops were made. In original trip from London to 1 gypt was made for the purpose of militars inspection, and it was then decaded to continue to India with stops in Misopotamia for further inspection duty. I rout Delhi to Calcutta the machine carried stypt route.

There has been considerable discussion with reference to an acrial mail service between I ugland and India British Acrial Transport Committee considering that the trip from I ondon to Calcutta can probably be made in four days as against the minimum of 18 days via Brindist required by rail and ship. Investigations are now being made with a view to establishing an nerial mail service in India and it werns reasonable to predict that within a few months one will be in operation With the easily obtainable average speed of 70 miles an hour the journey from Bombay to Calcutta could be made in 17 hours instead of 46 by rail, the Bombay to Calcutta could Simils trip could be cut from two days to 14 hours and karachi would be only 10 hours from Delhi instead of 48

Taking the mileage reading of the tire tested over the roof course

## THE S K F INDUSTRIES INCORPORATED announce the institution of a scientific organization for the study of anti-friction devices with the intention

- —of setting on foot a thorough and scientific study of friction and the application of more improved anti friction bearings,
- —of offering to American manufacturers in every line a bearing engineering service designed to investigate any manufacturers bearing difficulties and offer advice as to bearings exactly adapted to his specific needs and
- —of endeavoring through the bearing knowledge developed in this manner and through its scientific investigations to be of assistance to the entire bearing industry in the improvement not only of design but also of methods of application

With the conviction that American manufacturers will welcome assistance of a scientific nature in the solution of frictional difficulties the S K F INDUSTRIES has established a service, entirely scientific in its intention entirely divorced from the sale of any specific type, for the study of bearings in relation to manufacturing

Heretofore such assistance and advice have been rendered solely by bearing manufacturers as individuals. It is hoped, through concentration in one unified research, to organize the investigation of frictional problems and the giving of advice thereon in a more thorough manner overcoming the past limitations

The new bearing service will be both scientific and immediately practical. On the scientific side, centering in its engineering laboratories, which will be completely staffed and equipped for research of a difficult nature, it will undertake the investigation of the frictional difficulties and losses involved in the

On the practical side, the bearing service will place at the disposal of manufacturers, a staff of engineers who will go into the plants of any manufacturer investigate his specific bearing difficulties and offer advice as to the type design and application best calculated to remedy such difficulties

It is hoped, further, through the data gathered in this plant service to manufac turers, coupled with the findings of the research studies to establish resources of knowledge that will be of assistance to the entire bearing industry in the improvement both of design and manner of application

The S K F INDUSTRIES is peculiarly fitted to undertake this long-needed service to American manufacturers inasmuch as it represents a pooling of experience of two manufacturers whose past activities in the application one of the deep-groove type of bearing, the other of the self-aligning type have brought them into almost daily touch with every type of bearing. Combined with these is the experience of a company whose engineers energies have been devoted solely to the manufacture of balls, a phase of the industry no less important than the completely assembled bearing itself.

To those who know of the S K F Ball Bearing Company The Hess-Bright Manufacturing Company and the Atlas Ball Company this massing of experience and engineering abilities, further to be re-enforced by the study of bearings from the research side, will mean advice with the impartiality of scientific effort and resources of practical knowledge not to be equalled by any other one organization

American manufacturers are invited to avail themselves of this beam, service at any time

value than the gross total of all electric imports into South Africa in the past

### Joinary Planes in Demand

Before the war Germany conducted an extensive trade in South Africa in small to let of all descriptions expe-cially in joiners' planes. A areful study was made of the models chiefly in demand and these were supplied at praces which made both lugland and American

were those used for smoothing roughing and molding Among the white population of South Africa, which is approximately 1,500 000, American wearing apparel in medium-priced grades is liked As the additional millions of natives gradually acquire civilized customs, the sale of all sorts of clothing and articles of personal adornment will expand There is not much chance of adornment will expand There is not much chance of soling American leather goods in South Africa A man from Johannesburg brought with him a large, well-made brad-case of South African amultacture for which he paid \$50. The price quoted for the same kind of brad-case in the United States was \$85, he said A good quality of leather is produced in South Africa.

quality of leather is pro-duced in South Africa.

The American exporter has the choice of several South African ports to which to send his shipments. Cape lown is the principal import. center, but goods consigned to the interior had best be routed vis. Alona Rev. (Porto the interior had best be routed via Algoa Bay (Port Flizabeth), where conditions for handling such freight are far better, railway facilities far better, railway facilities as compared with Cape Town being more adequate, and goods receiving more careful handling. Naturally, Great Britain and its colonies have an joyed the larger proportion of South African Trade

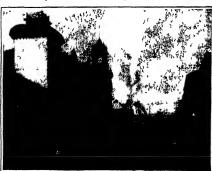

Among the merchants of the Union, however, America is one of the most favored

ations, and all manufactured products from the United States are very well regarded Practically every prominent importer handles Amencan goods 80 far as the starff in concerned, importers from the United States and other countries pay three per ceal higher duty than those from the Britain Empire Most of South Affect's diamends and in reach the United States through London and Sungapore Direct steamnible lines between Amencan and South Affects would not only keep for us the larger share of business and the state of the s

gained during the war, but would extend it materially

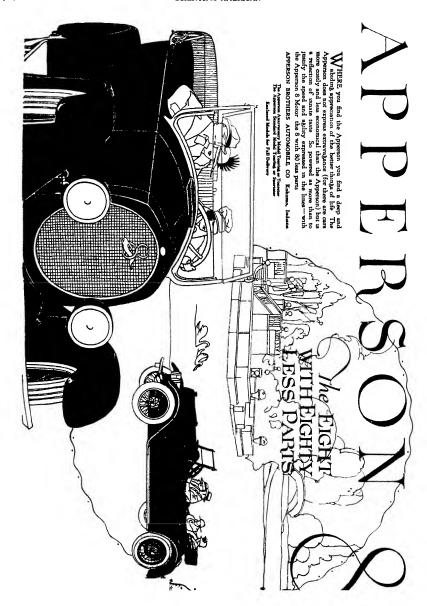

Importers in South Africa have ex persenced much difficulty in clearing goods arriving at their ports on vessels sailing direct from New York, because the bills direct from New York, Decause the cuis-of lading are usually sent by way of Eng-land. This disadvantage may be under-stood when it is realised that cargo steamers, stood when it is reasised that cargo atcamers, sailing direct, generally complete the voyage in about 30 days, while letters going by way of England take from 40 to 50 days This means that the documents reach Houth Africa until 15 or 20 days after the goods have arrived by a direct route. The importer may obtain possession of his goods by executing a bond for the production of the bill of lading within a reasonable time, provided that duplicate invoices, properly itemized and containing the required customs declara-tions, are forwarded on the steamer taking the shipment. If this is not done, the South African authorities assess the goods according to their judgment

All-American agents are needed for hand-ing our trade in South Africa. One American manufacturer who introduced his products

manufacturer who introduced ha produced increasefully through an experienced temperature and conducted an extensive adjections examinate paging narranged on exclusive access with a Fiftigle firm handling one or two other American films and tant or a doesn British articles. Sales were established for a mantha, but after that they fell off steadily. ### The Heavens in May, 1919

The Solar Eclipse of This Month, and What Astronomers Hope to Prove by It

By Professor Henry Norris Russell, Ph.D.

THE present menth is notable for the occurrence of a great college which happens on the 20th and affords the longest view of the surroundings of the sun while its own dik is hidden which has been possible for many

At the time of this celipse the in-n is within a day of periges and unusually near the cartle ber distance being a little less than 2.31 000 mile. In a nequence his tapering shadow is still nearly 150 miles in diameter tapering smalow is sun in art 180 miles in minure, where it roaches the earth's surface and observers statated within the belt ib at \$ 000 miles in length over which this shedow we possible to cover the dark will see a total solu (clipse of minusual durition). which at maximum may amount to six minutes and

The echase track is rather unfortunately situated Beginning in the Pacific Occan just off the coast of Peru beginning in the relate Octain just on the close in Fer-it aways a cross South America traversing the Bolivian mountains the firests of Brizil and the higher lands of the castern coast. Then it crosses the Atlantic, almost along the equator just grazes the southern coast. amous among the equator jost graves die souther a coast
of the great western projection of Africa, passes tem
porarily ut to see again and crosses the main part
of the dark continent by way of the Congo basin and
lake langanyika—finally knowing the
searth's surface at a point in the Indian
Ocean not far from the African coast

The region within which a partial colipse is visible extends far northward and southward including practically all of South America except the extreme southern tip, and all of Africa except the Methterranes coast. The region where totality is longest lies in the Atlantic, and the maximum duration of culpses observable from land stations is about four influtes, with is reached on the cast coast of South America. and the west coast of Africa. There is to be sure, one small island in the Atlantic, lying almost in the central line of totality where the cclipse lasts fully six minutes, but as this spot known as St Paul's Rocks, consists of a few jagged rocks rising to a beight of 60 feet from deep water, with no anchorage and no from water, it is hardly an inviting station for even the hardiest astronomer in spite of the fact that certain optimistic souls have nominated it as a way station for transatlantic airplane flights

The chimatic conditions along most of the track are unfavorable—the best chances the track are uninvocable—the best chances
of fine weather being on the high lands
back of the eastern coast of Brazil and in
central Africa above Tanganyika On
account of the remoteness of these stations, and of the disorganization resulting from the war few expeditions appear to be projected to view the celips. One English and one or two American parties however, are likely to make the journey

It is to be regretted that the chances for observation are not more numerous for this eclipse is of very considerable scientific

this ethies is of very considerable scenam.
Importance The usual observations of
the 'flash spectrum at the moment when the sun's
atmosphere is being hidden behind the advancing edge
of the moon, ar coming out again on the other side can
be made. The long totality affords an exceptionally chame for observations of the corona and photographs of the sportrum. But the observations of greatest interest which are possible at this time deal with quite another matter and one which is exciting a very lively interest imong physicists is well as astronomers at the present time

### Motion or Relative Motion ?

Let many years physicists have hoped and sought to device one means of measuring directly the earth's motion through the other who hemisters the vibrations and the mergy of light. Successive experiments of and the negs of hight. Su cossive experiments of increasing in control and delicies, have all failed to detect any set off of though in some cases it should have been vive eight to the meaning in the though the some failure left the little of the now fumous theory of Relativity a sile tire too extensive and intrinsit to go into hore furth r than to so, that its find uncertail assumption is that Nature is of such a character that it is impossible to detect that my body it syst in if bodie as in uniform rectifinear motion by any physical experi-

ment whatever unless there is some other body outside the system in which case the relative motion of the two, and that alone is observable

Viemirkable extension of this theory has been made A rimitable extension of this thiory has been made by the physical Function—Swise be light but long results in Germany who has it to upded to include results in Germany who has it to upded to include rations. He work as introducely outdownstrial and ex-trainty difficult but certain consequences of his thory are rasky comprehensions plant if there were no other planet to perturb it would not remain ab-on other planet to perturb it would not remain ab-

solutely fixed in position, but its longer axis would slowly solutely used in position and in the more assessment of the same at a rate why he can be calculated from a matern as theory. When applied to the actual planets this theory gives results a small to measure, except in the case of Mercury, but here it accounts for a large distributed between observation and previous gravitational theory, which had been known and had gravit (100mit 100my, where mad to it amove and one purzaled actronumera for many to use very to the point of leading some of them to postulate to ad littonal planet vulcen made Mercury's orbit. Not uncrely thus, but of accounts for these effects quantitatively, the calculated and observed effects agreeing almost absolutely. deflected by nearly two seconds of aro, while for rays passing at a greater distance, the deviation should be in-versely proportional to their distance from the sun'scenter

versely proportunated four distance from the sun security. It is then easy to see that a star which we saw by light which had almost grazed the sun should appear to us to be shifted away from the sun's center, by the amount just stated. But we can only observe stars close to the sun at the time of a total eclusee, and one star alone will not do We must have several an different sides of the sun and some nearer than others so that they appear to be shifted in different directions and by different amounts be shitted in different directions and by different amounts. Then, by photographing them during totality and measuring the photographs, it should be possible to determine whether their apparent positions, relative to one another, have been altered as the theory domands.

The present eclipse is remarkably favorable for this investigation, not only because of its long duration, but still more because the eclipsed sun happens to be right among the star cluster of the Hyades, with numerous and excellent reference stars on all sides of it. An at-tempt will be made to get photographs suitable for exact measurement with instruments of long focus, and if only the weather is favorable, it nught to be possible to settle this important question once for all

NIGHT SEV. MAY AND HINE

This is a strong argument in favor of Lilistoin's theory. But secondly, his theory also predicts that light originating in the sun, where the gravitational attraction is very strong, should have a slightly longer wavelength than light emitted by a similar atom on the earththings happening as though the powerful solar gravitation slowed up the luminous vibrati in by a minute amount Very careful measures by De St John of the Mount Wilson Observatory show apparently beyond ques-tion that no such effect is present. So we are left again in une reainty

### The Sun and the Light from a Star

This is where the eclipse observations come in, for I matern a theory products that a ray of light, passing close to a great gravitating mass like the sun, should be slightly bont inward as though the sun attracted the light and deviated it from its rectilinear I has as in many ways the most remark able of the

cours quences of the theory but to determine by ob-sets thou whether it actually happens is not easy. The sun is the only attracting body within our range which is big enough to produce a perceptible effect. A ray of legit which almost grazed its surface would be

### The Heavens

At our time for star-gazing, which is an liour later than through the winter, to allow for "Daylight Saving," we find Arcturus high in the south and almost on the ineridian Below him, and to the on the meridian Below him, and to the right is Spies, while farther down and to the left is Antares, with the head of Scorpio above, and its tail dragging down to the horizon Low on the southern horizon is a part of Centaurus. The two brightest stars of this constellation are invisible in our latitude, but at this time observers as far south as the Floridan peninsula may see them low in the south Alpha Centauri, the easternmost of the two, is the brighter, and the line of the pair punts toward the Southern Cross Returning to our own skies, we find

Hydra stretched along the horison from south to west, with Corvus above, then Leo well up in the west, with Gemini setting in the northwest. The Great Boar is high above the pole, and so are the Isttle Bear and the Dragon, while Cassio-pers and Cepheus are low in the north Cygnus and Aquila are low in the northeast and east Lyra, Hercules and Corona are above them, and Ophuchus and Serpens fill the southeastern sky

### The Planets

Mercury is a morning star this month, and is well visible at its beginning, as he reaches his greatest elongation from the san on the 6th. Shortly ster that date he rises at 4 A M (by the clock) and should be easily seen in the dawn. He is in Pisces, and much brighter than any fixed star in the vicinity.

Vottus is an ovening star, and exceedingly conspicuous, heing very far north, and remaining in sight until well after 11 P M She is in conjunction with the moon on the 2d, being about three degrees north of her and this will be a very lavorable time to pick the planet up with the naked eye in broad daylight Mars is in conjunction with the Sun on the 9th, and is

invisible

invisible
Jupiter is an evening star, and is not far from Venus,
higher in the sky before the 25th, and lower after
Saturn is in quadrature cast of the Sun on the 13th,
and crosses the meridian at 7 P M by clock time

Uranus is on the opposits side of the heavens and is in western quadrature on the 23d, so that he is observable before sunrise.

Neptune is an evening star, observable. only just before dark

The moon m in her first quarter at 8 P. M. on the 6th, full at 10 P M on the 14th, in her last quarter at 6 P M on the 22th and new at 9 A M on the 29th—the P M on the 22th and new at 9 A M on the 29th—the day of the great eclapse She is nearest the earth on the 28th, and farthest away on the 13th While she travels around the heavens, she comes into continuous with Venna on the 2d, Jupiter on the 4th, Saturn on the 7th, Uranus on the 24th, Majority on the 28th, and Majority on the 28th. machine in each section consist of two parts of 16 pages each If desired, however the web after being shi in two can be carried over to a single folder so that a 32-page section will result | The method of folding the paper is clearly shown in the illustration 1 inst the web is carried over a form erosawise cut and dropped on a traveling conveyor. A special counting mechanism pushes every lifticth paper a little further out so that an accurate count of the num ber of papers may be had

When it is desired to use more than one col ir the bottom web may be carried up through the cylinders above it and they may be inked with color. In fact, a single web might be run through all of the cylinders of the section receiving eight differen color impressions. When printing several colors and when printing fin half-tone work it is necessary to prevent offset of color on the impressions rolls and transfer of the solur back upon the p per This is prevented by the use of a sil of thin offset paper shown on the let hand side of our illustration. It will be understood that the second web from the ground is no running and that the bottom web is running through the second row of cylir lers to take on extra colors then the offset paper runs on CATA colors then the offset paper runs around the second impression cylinder just beyond the first plate cylinder and as rolled up again on a take-up roll which may be seen behind the larg roll in the illustration

In a large machine of this character, the main problem is to supply the press with paper. The cylinders govolve at about 360 revolutions per mineta, which means that the paper travels at the rate of nearly

\$4.00 \$4.50 \$5.00 \$6.00 \$7.00 & \$8.00 If you have been paying \$10.00 to \$12.00 for fine shoes, a trial will convince you that for style, comfort and service W.L.Doughas \$7.00 and \$8.00 shoes are equally as good and will give excellent satisfaction. The actual value is determined and the satisfaction. The actual value is determined and the retail price itsed at the factory before VL. Douglas personal guarantee that the shoes are always worth the price paid for them. The retail price are the same everywhere. They cost no more in San Francisco than they do in New York.

Stamping the price on every pair of aboes as a protection against high prices and unreasonable profits us only one example of the constant ex-deaver of W.L.Doughas to protect this custaeme. The quality of W.L. Doughas product is guaranteed by more than 40 years experience in making fine aboes. The smart styles are the leader in the fashion centers of America. They are made in a well-equipped factory at Brockton, Mass., by the highest paid, skilled shoemakers under the direction and supervision of experienced men, all working with an honest determination to make the best shoes for the price that money can buy

CAUTION—Before you buy be sure W.L.Douglas name and the retail price is stamped on the bottom and the inside top facing. If the stamped price has been mutilated, B E W A RE OF FR A U D

## Electric Shovel for Underground Mining

A' electro show I designed to in the ground mining I was Ohi mining I was Ohi mining as a departure from the shoulder I thin rich swing type of stream should as construction adopting it to the introne. prentiar to undergrant prettia. Be sites being d sign 1 1 1 1 1 10 m restricted space at its 8 1 1 ft (1 t it an be quickly dismant) 1 1 1 1 issuing on be query standing to prove through narrow later in Figure 2 was the hosting or viny so so in the polling movements protoff to the man are all controlled for them is single methal speed type of motor equipped with first no control. The shovel relations controlled with the ton control. ing through a complete cir le has the advantage of being able to work in any direction and to load cars quickly at the

Cost figures supply 1 by a northwestern aron company covering a period of laurand a half years show a saving for the shovel over hand later. The ore loaded was 25 per cent fine and 75 per cent lump the largest pieces being 2 feet 1 v 2 feet 1 v 18 inches the output 150 t 220 tons daily

Power curves for one of these she vels equipped with a 20 herse pawer motor taken while loading five his cultive ears of iron ore show an average of 16 % have power. Operating in an iron name in Ni w York over a period of nine menths the shovel loaded 37 208 time of ore into 13 022 cars the cost figures unnounced comprise \$1 824 for 1d a \$1 255 for supplies and \$122 32 for power. This includes the expense of loading and tramming the ore about 400 feet a expense of moving the sh vel to different locations and it brings the average gross cost per ton down to 16 6 cents as against 30 conts under the sime conditions by hand labor. The net saving fr nine months was \$5 000.

#### A Housing Propeller for Small Boats

FROM Canada comes the ingenious two illustrations. I veryone who has handled motor craft in shallow waters patticularly in waters infested with sea wood grass and reeds knows what trouble may be caused by these obstructions becoming entangled in the propeller. Also where a landing has to be made in shoal water er over but im that is covered with be ulders the possibility

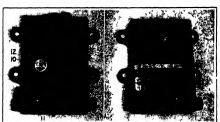

of the propeller striking bottom is the ouse of mach

The electric shovel that reduces underground mining costs

anxiety the lorouto people who have brought out this device have made the prop fler self protecting. This has been due by inserting a universal joint in the propeller shaft and building within the the shaft and propeller are automatically

and at its outer end is divided into two arms in of which supports the outer bearing of the propeller shaft, while the other curves downwardly to a sufficient dipit to act as a shilld or guard to the prop if r blades. The propeller can be raised a lowered by a hand lever which

Exterior and interior view of the interrupter for airplane engines

hit I on striking bottom, in passing over a sand bar or rok or in running the boat ashore on some sloping beach. The engine and the propiller housing are prictically installed so as to bring the cuttre weight amidships, and within this housing is placed a highed proceeding skeg while prices have been seen as the control of the housing the prices are the top of the housing lifte I on striking bottom, in passing over

engages a ratchet, but in case of striking an obstruction the ratchet is so adjusted that the propeller will be automatically lifted to a sufficient distance to clear the object | he housing is built water-proof and is provided with place held in place by thumb-serews which can be removed for inspection when it is so desired

## Stopping the Engine Automatically When the Propeller Breaks

When the Propeller Breaks

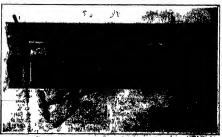

Until recently the breaking of an arphane propeller while in full flight has always been accompanied by more content of the property of a tractor plane, in the event of its propeller breaking, is to go into a tail stall. Index such conditions either type of machines the plane to go into a tail stall. Index such conditions either type of machine is apt to pass lake a spin as a result of the unbroken blade tending to white the propeller property of the propeller property of the propeller property of the property swing the machine around a neutral, or pivot, point between the center of pres-aure of the unbroken blade and the center aure of the unbroken blade and the coun-of torque. Other factors may increase or lessen this influence, and the engine may or may not go overboard as a result of the unbalanced torque reaction.

The resulting intense vibration is apt The resulting intense vibration is apt to break a gasoline line, and, conse-quent upon the continuance of the flame of combustion exhausting into the gaso-line-charged atmosphere, be followed by inner-larged atmosphere, be followed by fire Sometimes the most perfect mental and physical coordination on the part of the piot fail to prevent than a since the brain and hand can seldom set queen enough as many thoroughly understood accritonts of this nature attest. This manual initiation will be better railised when we consult that the time stateval per revolution for infrance anguste, asper revolution for airplane cagines, as-naming full friendle, vanies from one twenty-thrid to une twenty-seventh of a second . Iven under peace conditions some of our best polots have been inable to prevent fail crashes following such inchaps: This is partitularly true at the prevent time with the high powered origines, high engine speech four-bladed prepolers, and the general land stresses employed

employed
Under the auspress of the National
Advasory Committee for Aeronauties
and with every facility offered by the
Navy and Army air stations, Theodore
Douglas of Beocklyn, N Y, has developed an ingenious interrupter which
automatically interrupts the engine ignition, thereby stopping the power development of the engine, in the event of
the propeller breaking, or other similar
breakage resulting in a serously unbalanced condition of the power plant
The interrupter, which is depicted in
(Continued on page 474)

#### America's Optical Emancipation

(Continued from page 455)

an approciable amount of lead oxide is called a fint glass without such amount of that oxide it is a crown glass. The different types and varicuss of glass have different refractive indices and relative dispersions and are made to serve different optical requirements.

When the pot a filled with the ingredients the mass speedily becomes liquid in most cases assuming the consistency of their key rup or glycerin. The temperature of the furnace is maintained until after the glass is ready to be surred. This is determined by proofs taken at as a bouns, first tests in linear candy in the making. The glass is stirred by a mechanical device being accomplished by a clay rod on the cird of a water-cooled tube. During the lister part of the stirring the temperature of the furnace is allowed to fall and the stirring the stirring the temperature of the furnace is allowed to fall and the stirring the stirring the temperature of the furnace is allowed to fall and the stirring 
This stirring pricess is highly important. I post target dip used the elimination of those fatal defects of strain and strain or strings running through the glass of a lower refrix tive under than the cast. The impredients of the mixture are of different specific gravity—the more thoroughly all of the materials are mixed to render the whole mass homogeneous the least the damper of string.

The temperature of the pot of molten glass as accurately determined throughout by means of an optical pyrometer. This instrument contains a small inconfidenced lamp the color of which varies with the intensity of ris heat which tomperature it registers on a dual. The furnace operator looks at the molten imass with the pyrom eter through a small aperture in the furnace door. When the color of the incondiscent inlament exactly matches the color of the glass he reads the supprature.

Cool of the guass needs to be finished the furnace door is lifted and five or ax workmen transling a long p-table crase into position pick up the white-holf pot and transfer it to a cooling urasee, and another pot previously heat of takes its place in the melting furnace. The entire process of melting and strr ng has consumed from 24 to 48 hours and the gradual

and the melting informed. The entire process of melting and string has coosumed from 24 to 48 hours as I the gradual cooling takes froe rax days longer. The pot is then taken from the cooling france and broken up. The resulting chunks of glass are examined, and shows the string of the defect of the cooling france and broken up. The resulting chunks of glass are examined, and those showing string of the three policy of the cooling france and the second process of the cooling france and the cooling f

## norical Emancipation

(Continued from page 489)

as usable is cut to the size and weight deured and supressed in the pressing furnaces into the approximate form in which it is to be used

The sulminating processes in the manu The summinating processes in the manufacture of glass for ophthalmic lenses are still more spectacular. The pot after being takes from the melting furnace is not allowed to cool but is suspended from an overhead track and hurnedly conveyed to a position above a large iron casting table. On to this table the molten mass table On 50 this table the motten mass is poured in front of the huge iron roller which is set in motion and the glass rolled into a perfectly even flat sheet. This glowing sheet is at once projected

into the annealing oven or traveling lehr' as it is called, where it is slowly ad se it is called, where it is slowly advanced into sones of constantly lowered temperature. The oven is approximately 100 feet long, and the sleet of glass requires about six hours to pass through it the mperature ranging from approximately to room temperature in the process Annealing is the timi process for all optical glass and is very important to its physical usefulness. In that process of gradual cooling under carefully regulated temperatures the molecular strain of the glass is relieved and the liability to breakage in future handling greatly lessened To quote Major Wright in conclusion

'The path leading to high precision is straight and narrow and constant vigilance is required not to deviate from it Optical glass as a thing of high precision

This is another path which American industry has traveled thanks to the am bitions of John J Bausch and the unfaltering determination of his son to see them realised. And now as the father ap-proaches his 90th birthday he beholds what he hardly dared dream of when he started his doubtful venture 66 years ago-America optically freed from the last trace

#### Increasing Visibility Through a Knowledge of Camouflage

which had for its purpose the deceiving of the submarine? The Jones visibility meter is now being utilized in a series of studies which have for their object the working out of schemes of painting which will meure the highest measure of visibility and emphasize the direction in which a vessel for instance may be heading. That is to say, the desire is to determine just what colors will make a ship conspicuous where now her somewhat indistinct appearance may confuse an observer regarding her actual course. The results already obtained show that red and black already obtained show that red and black for example, have marked yearbility, and it is highly likely that these and other colors when laid in a suitable manner upon the aurfaces of a craft will go a long way toward making clear a vessel a line of advance and, to just that extent lessen the hasards of collision The movement of shipping will be further aided by similar improvements in the coloring and marking. or snipping with be further studed by similar improvements in the coloring and marking of navigational guides, such as light-houses, lightships, buova and bescons By parity of reasoning aerial unvigation by parity of reasoning serial invigation and the finding of directional landmarks can likewise be facilitated. The sema-phores and other agnals employed by railroads may be made more possive by the adoption of new color coatings and there are the best of reasons for believing that vehicular traffic in mounded thorough and the ever widening tide of autoad motor trucks will find this

reaction Theology the War (Contact was as 1887) to Business of page 487.

and shell holes, because short rails were always directly in front when needed But to return to the work of M Briton and Major Boissin, who during the earlier part of 1915 were urging the use of cater part of 1915 were urging the use of cate pillar tractors as tank mounts because they appreciated the great tractive effort of such vibrices and their general maneuver ability over all kinds of terrain Casting about for tractor ideas, these inventors con sidered two American agricultural tractors one of which had an excellent platform for the mounting of the tank body, while the other had a better means of propuls on Taking the best of both designs they set the Schneider works on the task of evolving enterpillar tractors suitable for tank eer struction On December 12th, 1915 the struction On Documber 12th, 1915 the I round army lenguages placed as order for 10 caterpillar tractors with the Schnei ir organization which were delivered same four months later. However this number was considered much too small for any was considered much too small for all tank attack destined to overwhelm the enemy on a given length of front at I steps were taken by the inventors to in terest the French high command which up to that time had been most hostile to new ideas | Lxperiments were conducted during December 1915 with caterpillar tractors over the recunquered battlefield of Sousin in Champagne in order to con vince the military men that these vehicles vince the mittery men that these ventices, the could operate over rough terrain 'till the military men were unconvinced. They admitted the shility of the tank t cross all obstacles but pointed out its vulnerability to artillery here.

It was then that Colond Estienne, wh

has long since been made a general in direct charge of all French tank forces became interested in the possibilities of the tank idea. He advocated the construction of a large number of tanks, and through his persistent efforts he finally obtained the necessary authorization from the French high command From 10 the number of tanks on order at the Schneider-Creus establishment, was increased to 400. In order to check up their plans, the French took two American Holt tractors and with took two American Holt tractors and with their components constructed a single large tractor suitable for tank purposes, all in the short span of two weeks During March, 1918 this improved tank peaced through the most rigid tasts without difficulty and was the cause of the French government placing another order with the Start E-bound removation for war. government piacing another order with the Saint-Chamond organisation for many more tanks. The details of both the Schneider and Saint-Chamond tanks are too well known from previous descriptions to require further comment here
All the while the French kept the British

authorities informed the latter going ahead with their own tank experiments in external appearance the British tanks are different from the French, the pro-pulsion and general details are quite similar At any rate because of their rapid manu facturing processes the British were ready racturing processes the British were ready to employ their tanks in September, 1916 during the battle of the Somme while the I runh Creusot tanks were just beginning to come out of the works In fact, it has been pointed out that our British Allics were somewhat too hasty with the releasing of some 40 tanks which they then had ready and if they had waited until the French also were ready the combined attack might have had a more important effect on the surprised (sermans. As it was, the Germans quickly recovered from s tank defense which es to be heavily when the French opened up with their tank attacks during April, 1917 Indeed, the first employment of the

French tanks in the gr at battle of the a failure, because tank action were little understood M Breton called the atten ar ton of the authorities o the misapplica into of these waspons, and suggested their use as a means of surprising the enemy though the user as a means of surprising the enemy through the user as a mean of surprising the enemy through the user and the

In getting back to a peace-time basis every industry, large or small, can obtain valuable engineering assistance from the General Electric Company

## Back to "Cits" Again!

how electric power helped an industry "about face" twice in the same year

To equip and keep an army of four million in clothes was the task set for the textile in dustry. No notice to get ready was given, no time to prepare—just orders to do it and do it quickly

Then, the armistice—from a clear sky the signal to get ready for demobilisation—to get back to making 'cits

Only those close to the men responsible for pro Cuction know how the textue mills passed through these two crises Wires hummed with help us all you can and the quick answer came "count on us to the limit"

Mill power specialists of the General Electric Company jumped off trains in town after town. And G E engineering and manufacturing facilities were placed at the disposal of the mills facing the task During those trying days a G E Specialist was the man of the hour and it is a matter of record that electric power solved many a knotty production problem

In the cotton woolen and worsted mills throughout the country, 75% of the electric power used passes through G E Motors The largest mill building in the world (The Wood Worsted Mill of the American Woolen Company at Lawrence, Mass, is equipped with General Electric Motors supplying 16 000 horsepower G-E Motors also predominate in the great workshops of America a clothing manufacturers

These accomplishments in the textile field are an example of how the General Electric Company serves American industry. Its great manufacturing plants, its corps of engineers, its power specialists—never further away than a few hours inde-are at the service of every manufacturer.

Look for thu the mark of leadership in electrical development and manufacture

(Continued from page 471) Cambras which was after all the original

purpose of the tank idea.

During the carlier part of 1918 M Renault a Irench automobile engir nonautt in react automobile engineer, began turning out small two-men tanks in large numbers. These tanks were considered more anticed to tank tactice than the larger tanks for after all it is large numbers and small size which counts most. with tinks The B The British followed suit

And then, during the Allied offensives starting with the great counter attack of Init 18th, after the German drives had of the British and French armies came into play With little or no artillery preparaalong the long line without warning His quired them, for that was one of the great advantages of the tanks. His barbed wire and deep trenches counted for little, for the little tanks got over them and set to work with their cannon and machine guns

The German auti-tank defenses failed to stop the Allied tank lleets, there were too many of them even after the enemy had inflicted heavy casualties. Up and down the line, where the Germans had long held superior numbers at hav because of their wire and numerous machine guns, Allied troops came through in over-whelming numbers behind the moving walls of tanks Collapsed German dethe moving walls of tanks compace German de-fenses, retraining arms a disorganized supply lines and futally a more or less complete rout brought the supposedly instituble German army to its knees And from that point on, the story is well

After all the tank and its proper employment proved the one tactic which conquered a powerful and well intrenched Before the tank was introduced, large numbers of attackers fell before the barbed aumbers of attackers fell before the barbea were and intense line of the defenders. Artillery preparation made the attack all the mere difficult by giving warning and by making the termin impassable for supplies tween the interrupter terminals and the supporting artillery. With the The interrupter can be made in two and the supporting artillery With the coming of the tank, however, the harbed wire belt lost its defensive value, and today the advantage again rests with the attacker

## Stopping the Engine Automatically When the Propeller Breaks

(Continued from page 468)

the accompanying illustration, supplements the section of the pilot in such metaners, and through practically instantaneous action interrupts the power development thereby confining the danger to the initial breakings. Such as breaking as seldom seconds in itself. The interrupter is particularly desirable on tamerague machine, as such as norticed happening to one entire would cause the confinement to the disclosure of the confinement to the disclosure to the confinement to the disclosure to th the good engine to tend suddenly to swing the machine around and probably into a spin On such machines the interrupter both engages, thus maintaining an approximately normal flying position The landing with dead engines, or of switching off his damaged engine and continuing off has damaged engine and continuing he flying state that he good engine and reflying string with his good engine and reduced speed in the equipment of

and may be described as consisting at a line or extremely strong and may be described as consisting at a line out extends of the strong and an action of the strong at a lowering on a plane transverse to the internal combesting againsts. Under a to swing on a plane transverse to the internal combesting againsts. Under a saw of rotation of the propeller, By their efforts to develop seeding their actions of the strong and their contractions of the strong

The Invention That Won the War | normal amplane operating conditions, to a very limited are in its plane of move-ment. The amplitude of this movement is determined by the weight of the bar, the intensity and frequency of the transopposing strength of the springs confining it. The extended end of the trigger 3 is constantly pressed toward the floor of the constantly pressed roward use moor to the instrument by the compression spring 4, and is designed to engage the lath 5. On the under said of the trigger 3 there is an inclined surface 6, by which the trigger is rused A ball-pointed hardened steel series is fitted into the bar directly steed site is fitted into the bar directly beneath the trager, and designed to en-gage an inclined surface and thus to lift the trager when the swing of the bar is sufficient. When the tragger is lifted the latch 5 little dueler tension by the spring 7, is released and moves out of engage-ment with the tragger. The cam 8 is for the resulting of the latch through restant is hard. rotating it back into position by means of the push button 10 from the outside of the instrument

Now the compression spring, present-ing an inbalanced force, is designed to prevent the bar from disengaging the latch 5 as a result of cylinder misses coinciding with bad vibration periods of the engine etc, thus increasing the synchronism or from lateral shocks to which the plane may be subjected in landing in intense oscillating shock transverse to the axis of the engine, such as an unbalanced engine-propeller torque reaction resulting from the breaking of a propeller at speed are the types of shock from which the instrument is designed to repond inder such conditions the bar will swing through its full amphitude, raise the trigg; which releases the latch, and thus interrupt the ignition through grounding the magnetos From the interruptor terminals 11 and 12 wires are

connected to the grounding terminals of the magnetos and from top terminal of the interrupter a wire is connected to the engine ground. On the disengagement of the latch 5 (riple contact is made be-

general types maker and breaker matra ments and in various models for adapting it to varous systems of ignition

#### How Long the Oil Will Last ( ntinued from page 459)

to year and from decade to decade, it

might not be so difficult to see where the oil for the next few generations is to come from, but when each generation demands from four to eight times as much as its fathers used-well, there comes a time when it can't be done any more And if anyone desn't believe that we are now face to face with the time when the normal expansion of petroleum consumption must be curtailed he is respectfully invited to contemplate one fact, all the oil that has been extracted from the earth since the beginning of the industry, as indicated in the last section of the diagram, would last at the 1917 rate of consumption, less than 15 years. It would last, at the 1917 rate plus the ordinary increment shown for each year since 1880, a period of less than 10 years

No it is not in the least reasonable to sup-Durcture the gas bag

#### ne Flying Boat-Count Zespelin's Last Production

A MEMBER of the Allied Naval Com-In mission in German waters writing in the London Times, gives an interesting description of a grant monoplane flying boat, which he saw at Nordeny one of the largest and best-equipped of the German scaplane stations and which represents Count Zeppelin's last efforts in aircraft deum

This flying boat has a wing spread of about 130 feet, which is exceeded by that of a number of Albed and German muchines but an unusual breadth of wing of between 15 and 20 feet In surveying the great expanse and solidity of these wings an American officer remarked. I a Sopwith Camel couldn't fly off it while textile diers or similar apparatus. The of Curtus flying boats and incomparably more comfortable. Nor was the boat the only enclosed space. Between the wings was a stoutly built house for a pilot and containing, among other things a sound proof room for the wireless operator One of the German flying officers of the

station gave a brief history of this re-markable machine. The giant mono markable machine. The grant mono check if third to rapidly. It should be plane flying boat he said was the last possible however by proper regulation of grif of the great (out Espelin to the lith dry kilos to dry the wettest panels German people. He completed the design cerman peopii He completed the design of it before he died, but most of the con-struction and all of the experimental development of it have been carried out appointed over the failure of his airship the ground and by airplanes war he had hopes that the Zeppelin might be used for bombing enemy lines but it of losing it was too great. He realized that it was no good for this kind of work even before the Zeppelins began to be destroyed over England. So he set himeven before the Zeppelins begall to be destroyed over England. So he set him-self to devise a heavier-than-air machine powerful enough to carry a great weight of bombs, for use at the front, and this mono plane flying boat is the result Count Zeppelin at the time he designed this machine, did not believe it possible on account of its great size and weight to land it safely on the earth he dicided to make it of the flying boat type. It was to be kept at one of the scapiant stations on the coast of Belgium to rise from the sea, to fly over the front on bombing chose the monoplane type on account of the trouble we have always had from the lower plane of a biplane being knocked about by the waves in a rough sea. This one by the waves in a rough sea. This one great plane, over four meters above the water, is never touched by a wave unless the boat heels over very much when caught with a beam wind and sea. As it is built the boat heels over very murn were well as the built with a beam wind and as. At it is built to turn up into the wind of itself, even with a time from the contragency winding mill train are as site sould as the same even again for bombing as Count Zeppells, had suggested to provide a supposed to provide a supposed to the contragency winding mill train are as site sould as the proved it possible to be displayed as the contragency will be found to the first sould be such as the contragency will be such as the contragency of the contragency will be such as the contragenc

work it was proving highly satisfactory although it had to be flown -and espe-ually to be landed very carefully. We ere using this one principally to train pilots so as to have plenty of skilled men ready to fly a large number of similar machines we had under construction Whether these will be completed new I cannot say At any rate we are covincid here that it is the last and safest machine for leng distance flights over the

Gluing Veneer at Higher Moisture N ordinary commercial work it has been common practice among plywood facturers to dry their vencer down to very low mosture contents in fore gluing is accomplished other in plate reduces object apparently has been to preven that mose-probable that this remarkable entrinking of the acceptance of the appear is a platform and the consequent nearting of its appear machine would provide a platform and the consequent nearting of its appear machine from which the funtasite conception could and. In the munifacture of waterproof her calised. There would be loss room than plywood for ancualt use it was required on the turrest of a battle cruizer but the that the vince rootanh between four per greater speed of the monoplane as compared to a warship would inquisitionally time of gloing. This is higher than was and to a warship would inquisitionally a sustemant in many plants but was still pared to a warship would unquestionably time of gluing. This is higher than was actually accuse a small machine to rise without a destonart in many plants but was still foot of run. One could all but stand below ordinary are dry mosture conditions a number of places in some of the earlier products and them are a number of places in some of the carrier products and the products are the products and the products and the products are the products are the products and the products are the products and the products are the products and the products are the products are the products are the products and the products are the products types of submarines were successful to the hull of with case in glues at various moments on the boat was largely of sked and duralinining tents up to over 30 per cent. It was and basked to be from three to four times found that when very dry venter was and basked to be from three to four times. resistance tests was greatest Veneer glued at 15 or 20 per cent moisture or above gave practically perfect results in the water

The panels made at the higher mousture ontents were apparently as strong and as destrable as those glued under ordinary conditions but showed a tendency to

These results indicate that it may be possible to reduce very materially the cost of producing panels of sert an kinds where Count Seppelin was trribly discinnish is not important by using water sed over the failure of his sirship resistant glue and greatly reducing or even appointed over the latter of the attempt resident rich and the set of the set Before the hable to break or split than it is at higher moisture contents. An additional aving is therefore possible by reducing waste. It is realized that the use of moist veneer

is not practicable for many purposes but (arefully draid to low moisture contents for many kinds of panels which might be glued to good advantage at higher moisture

The above results were obtained with casein glues. It is known that damp It is unlikely however that moist of yeneer would be suitable for glues which are not water rougt ant

## Recovery of Waste Paraffined Paper

In the process of manufacturing para-fined paper and various products such as cartons cups and wrappers, large quantities of impregnated pap r stock are now wasted. In the making I paraffined paper alone, it is estimated the daily waste amounts to 8 or 10 tons

An opportunity for the revery of a large part of such waste paper and im-pregnating material is offered in the ap-plication of a method recent; developed at the Forest Products Labratory pro-

# WALTHAM THE SCIENTIF-ICALLY BUILT WATCH

The Riverside
The most dependable moderate price
watch in the world

## A Campaign to Aid You in Selecting Your Watch

THE hairspring is the brain of the watch. It is the most delicate tension spring mad. For use in the small sized watch 84000 springs are made from one pound of steel raising the value of that pound of steel from \$500 to \$30000. The Waltham hairspring steel is drawn through diamond surfaces and for the smaller watches to a third of the thickness of a human hair.

The Breguet or over coil (named after its inventor a fimous cld French witchmaker) is used on every Wilthim witch. The most important part of the complete operation in making a hairspring is the forming and tempering of this Breguet over coil

At Waltham instead of being formed or bent by hand as a separate operation the entire completed histopring is formed at one and the same time, after which it is hirdened and tempered in form—the invention of John Legin American watchmaker a genius who was a part of Waltham leadership in watchmaking—Indeed Waltham is the only watchmaker that claims this perfect method of making the Breguet hairspring

The foreign imported witch movement his a hairspring that is firs formed in the flat, then hird-ind and tumpered in the flat. Then the outer coil is bent to form the Breguet over coil which if the flat spring were as hard as the Waltham and properly tempered like the Waltham hairspring it could not be bent to correct form and would be hible to break in the ittempt.

Walthim superiority is, in original method scoret process univirying quality of every important part of the witch—a quality that cannot be equaled by the foreign 'hand in thod of minufacture. That is why Waltham kads the world in stindardi cd watchmaking and why your watch selection should be a Waltham

Routes and distances which are available to British and American airmen who are to attempt the great trans-Atlantic flight

## Our Navy's Bid for the Great Trans-Atlantic Flight

A GAIN the coming trans-Atlantic flight has taken an A week ago all eyes were turned toward Newfoundland where Hawker with his Sopwith toward Newfoundland where Hawker with his bopwith and Raynham with his Martivaside were momentarily expected to start on what is considered a deep rate vonture. Both those small hiplanes were hastly pre pared for the trans-Atlantic attempt and shipped to Newfoundland for an early start. But what with high velocity which storm areas in mid-Atlantic fog banks, ran, marshy flying fields and other i lements of delay rain, marray myng intus and orar rincines of users the present writing finds the intripid British pilots still waiting for favorable conditions to take off as the avisators say Perhaps the ill-fated start of Major Wood in his Short bipliane which resulted in his machine falling

in the water while flying between England and Ireland, may have had a deterrint effect on the British aspirants in Newfoundland at any rate, they are not taking the sheer desper ate chances which everyone expected of

their attempts
Meanwhile our Navys carefully laid plans and thorough preparations have been brought to what appears to be a successful and promising consumnation. Indeed during the past few days the NC flying boats have proved quite fit for the great ordeal before them. And these tests have ordeal before them. And these tests have even encouraged a remarkable record made by a Navy F-5 type machine, at Hampton Roads on Saturday, April 20th, which flew for more than 20 hours and covered a distance of 1,250 miles. The F-5 type is equipped with thre Liberty engines while the larger NC type carries four.

And while the aircraft have been rare-fully tested and prepared for the long flight, our Navy has gone ahead with other flight arrangements, such as a string of torpedoboat destroyers and battleships which will be strung along the onurse across the vast expanse of coesn, so that the fisers at all times will be in wireless communication with naval units. There are several possible routes. The two which have been favorably considered are from Newfoundland straight across to the Irish reast or from New-foundhand to the Agorea and thence to some point on the Continent. Of the two routs at appears that the one via the Agorea is the more likely.

While little is divulged by Commander John H. Lowers who is in tharge of the Navy's attempt at trans Atlantic who is in things of the rays, saturing it trans (timing flight and his men with regard to the lettraces and hattleships which will no doubt spun the occur for the benefit and gindance of the airmen it is quite evident that the Nav is taking no chan cowhisto yer. In fact the attempted flight is not unlike a long distance swim mer who while he must rover the distance on his own resources is escorted by one or in ore boats which are ready to pick him up if necessary. In sharp contindistinction to the attempts of Hawker and Raynham with their angle-engined biplanes in line or nit or guiding

Engines of the NC-3, showing the two regular tractor air acrews and the tractor and pusher air screws of special design in the center

vessels in which event they must either succeed or trust which is which could the mind coan our Navy s attempt is devoid of desperate hazards. It is not a sporting event it is rather a well planned test conducted along som tengincoing lines

More is known about the NC planes which are to

attempt the flight than about the navigating plans. The NC 1 which was the first of its type to be constructed. made a spectacular flight on November 8th last carrying 51 pass agers at a time. As originally designed the NC 1 has an upper wing span of 126 feet, lower wing span of 96 feet an overall length of 70 feet in La total hight of 25 fret It weighs 13 000 pounds empty and 22 000 pounds fully loaded. The useful bad carned is 4½ tons Although a big machine the C I has a speed of over 80 miles in here a 2 000-foot clim! in 10 minutes and a maximum endurance range of 13 hours

Three Therety cugines were originally in muted on the NC1 Each of these being of the low compression type develops 350 horse power. Lour bladed tractor an screws are used each measuring 10 feet 10 inches in diameter
The NC 3 and NC 4 which have since

been completed follow the same general lines as the NC1 except that they are equipped with four liberty engines and the arriver mean at present emission of the arriver wasts of three trills and one pusher. Thus fixing both hive a weful carrying enpacts of 12 400 pounds as compared with about 9 000 pounds for the Net so that the four rigging equipment may be

n iderel far more advantageous than the his engine equipm at despite the weight the engine equipm in despite the weight and full consumption of the extra engine which would require some 4.025 pounds of fucl and rid for a 24 hour hight. It is nucleistood that the NC 3 and NC 4 h vilor a speed of 95 unles in hour and has n han hing speed of 55 miles an limit. II gross loud capacity is 29,500 points although it is intended to start the orin although it is intruded to start the y in flight with not more than 28,000. The other measurements of these boots are (Continued in page 49.)

#### A Neglected Port

III port of New York so far as nature has had to do with the making of it is the greatest port in the world but the port of New York so for as man has done his share as a partner with nature is one of the poorest ports in the widd. We make this statement without any fear of controlicion As regards its loading and unloading fighties and all that ordered admistment of material means to econ muc ends which is the carmark of a great modern port. New York with the exception of the Bush Transit and the Chebra ducks is today, in a parlons state—like lopes at bus met growed

The clear-headed and for sighted chairman of an Shipping Board Mr Hurley more than once has stated that an important factor in overcoming the handicap of cheaper construction f ships in the vards of om connections will be the spec ling up of the form around of the shops of our new merchant marine in our own ports This is to result from highly developed loading and un loading machinery and the carefully planned layout of our dock facilities. Of course Mr Hurley at least so fur as the port of New York is concerned was looking to the future certainly he did not have in mind the existing conditions. At the present writing we are at the state of development where committees investigations reports and much perferved oratory prevail But surely it is about time that we got really and honestly busy in this the most important question affecting the commercial metropolis of the western hemisphere a vast problem which can be satisfactorily solved only by the cooperation of wide experience with the highest technical ability. If we are to had a quick and adoquate solution the whole thing must be absolutely divorced from state, and proportial tedities.

A fundamental our stion that must be decided at the outset is that of location Are the present centers of shipping activity the most favorable or should we de velop new shipping centers such as that proposed at Staten Island or in the lersey mendages?

Another studing mount in himomy one port facilities up to date is to guther complete information as to the terminal facilities of the leading parts of the world Presumably much of this information has already been gathe ed but there has been considerable activity du one the war and the record should be brought up to date

## A Year of the Carnegie Institution

TANKWING the exploits of the Carnege Institution of Wishington is a habit which we should be sorry to chanden. There is hardly any the la montary natural in the modern world respires as with just the same sort of emotion that we have from the Yarbooks 1 that idionable estal lishe at 10 we had lived at Mexandria in the days of the Ptolema, we make have emoved similar thirdly in perusing the period of reports of the Museum supposing that any were assued. The I tolerane investigators had the advantage of virgin fields for their idventures and they must have Indiamazing stores to tell. Research under the Carmene Institution starts at a different stage but it plunges so boldly note the illimitable unknown that

it is positively invested with the true thavor of picnoering Possibly some of our readers have never seen a Year-book of the Carnegic Institution. Let them imagine a volume of more than 300 pages, delectable in type and paper setting forth some of the most romantic true stones to be found in contemporary literature. Not that the writers of these stories debberately court popularity Their language is formal and technical It is faits not phrases, that excreme the spell

One of the many departments I the Institution possesses the most powerful telescie in the world, installed on the top of a mountain it (alifornia. Here is a circumstance to arrest public sitention, yet it is almost trivial compared with the ini total of facts concerning the equipment personnel and program of the Mount Wilson Observatory only the most progressive astronomical establishment in the world Another Carnege department has fucushed a pair of seven league boots to the once languishing science of terrestrial magnitism Biology is represented by several branches of the Institution, in each f which new vistas are continually being opened up Ail so on pretty much through the circle of the scu nee

No educated person can afford to 1 agnorant of what the Carnego Institution is doing to would be a praise worthy undertaking if Director Woolward would issue a popular and copiously illustrated vision of the Yearfor the benefit of the busy average man

In reviewing the report of the Institution for 1917, we indulged in a quizzual commentary in the subject of the upruffed exterior which Dr. Woodward and his associated managed to muntain amid the alarms of the great war I rum the current Yearbook it appears that the establish ment was, in fact, deeply stirred by contemporary events and that its resources have long been enlisted in the defense of the nation. Prol ddy the most con spicuous example of the patriotic since rendered by the Institution is the fact that the entire staff and re sources of its Comphysical Laborat in were intributed for more than a year in the vital worl of promoting the production of optical glass in this contry During this period the output of uncut onto il class was increased from less than a ton a month to me re than 100 toms a month and it was thus possible to supply the Army and Navy with telescopes, field glasses gor sights and various other optical apparatus, despite the cessation of this supply from abroad. Soveral other branches of the institution also to perated activity it war work or were well represented therein through the activities of their officers and employees

At the beginning of 1918 the Institution inti red a held of investigation through the acquisition of the I agences Record Office, located at Cold Spring Harbor Long Island This unique enterpric was previously maintained mainly at the expense of Mrs I II Harri man who has provided a fund of \$300,000 toward its further maintenand

Many of the more noteworthy achievements of the Carnegie Institution during the past year are recorded clay where in our columns

#### The Battleship of the Future

II VI is the best type of quital ship to build for the United States Nevy 18 is considered. to go aloud and build the two types which have been designed for our Navy namely, the 42,000 ton 12-run benyily armored 21-ku it buttleship and the 1" knot eight gun lightly armored batth-crimers that have been designed and appropriate I for Or would it be wiser to combine the two dismus in a composite ship, having something of the gun power and protection of th battleship and approximately the speed of the battle Navy that is the men who design and the men who tight the ships are giving this onestion close attention and already there is a division of opinion - Experts such is Admiral Mayo, Vice-Admiral Suns and Rear Admiral Richman, the three who have held the highest sum inds of the American service in the war zone. behave that the composite type is letter the men who were engaged at home including Rear-Admiral Fletcher and the famer il Board who advise in the material of the Navy behave in holding to the existing types. Meanwhile the chiefs of the bureaus of Construction Steam I squierring and Ordnanie are in Lirope making a study of this quistion based on the results of the war and on the material that was built for its prosecution

Those of our readers who interest themselves in naval affairs, know that the modern warship is a compromise In its completed condition it has a certain displacement or weight, and this is apportioned to the various elements that go to make up a fighting ship, all of which make their demands upon the tutal walcht available. So much weight must go for bull so much for engines and boilers so much for armor, guns, fuel, and general equipment and stores If one of these elements be greatly favored, it will be at the expense of the others, and he is the wise designer who can make a perfect distribution for the particular class of work in which the ship under design is to be employed

For these reasons, it follows that the battleship with a maximum protection has only a moderate speed 20 to 23 knots, and the battle-truser, in which speed is the chief desideratum, carries, relatively to the battleship, a lighter armament and much lighter protection

Now the British, as a result of their war experience and particularly in view of the lessons of the Jutland fight, have come to the conclusion that in a compromise ship of large displacement, embodying the best elements ut the buttleship and the battle-cruiser, is to be found the alcal capital when for the taction of future battles, so far us they can be predicated on the experiences of the war they laid down three great ships of the "Hond" which were under construction when the armistice was signed In agreement with their desire and expectation that disurmament and demobilization on a considerable scale would be possible, now that the arch enemy was gone they at once broke up two ships of the three, but because the Hond was very largely completed, they are finishing that ship The 'Hood' is about 900 feet in length and will displace, on English normal loading don't 41 000 tons, which will mean probably 43,500 tone with full stores etc , aboard . The is to have moderate battleship armor probably of about 12 inches, her battery will consist of eight 17-inch guns, or, possibly, of six guns of the new 18-inch piece, which fires a 3,600p mml shell | The speed will be 30 knots, which is about the best speed of any existing hattle-cruiser in the navles of the world

After a careful study of the subject, the Screwmen AMI BU AN IS included to the belief that the compromise The sinking of three British ship is the better type battle-cruisers by the 11- and 12-inch guns of the Germans proved that battle-cruiser armor, as carried by the British and Japanese which are the only navies which possess battle-crossers, is insufficient to insure the safety of such slips. In fact 6- to 8-inch armor is ab surdly inadequate whereas 12 inches of armor associated with sufficient ileck protection, will give a ship reasonable immunity His was proved in the case of the German battle-cruisers at Jutland, which, by the way, except for the rather light guns they carried, were practically of the new composite type. Increase the displacement of the 'Doefflinger" to 12,000 tons, raise her speed to 10 knots substitute 1 % or 16-inch guns for her 12-inch and you have an excellent ship of this new type

The hattle-cruiser must go it has filled its place in the history of the development of fighting ships and filled it well, but in an age when the principal batteries of the capital ships include our own 16-inch firing a 2,100-pound shell, and may possibly include the British 18 firing a 3,600-pound shell, the building of capital ships whose engine weights are so great that it is impossible to give the ship more than six inches of armor protection, is to invite disaster. If the speed of our battle-cruisers were cut down to .0 knots and the large amount of wright saved in the reduction of boiler and engine plant were translated into heavy deck armor, we would an ideal ship of the new type

The policy of the United States Navy, when war is on will always be aggressive. We shall attack, and one of the less defenses, both against gunfire and the tornedo. is high speed and a quick helin or mancuvering power I ven the buttleships of Jellicoe s fleet, which maintained a speed of 17 knots only during the battle, were very successful in cluding the torpedo, no less than 20, which passed through the line, being avoided by the use of the helm These, however, were partially-spent tor-Had the German destroyer flotillas been less cautious and closed into closer range before firing, the result might have been different. But a .. 0-knot ship with good lookout, and quartermasters who are on th job, would be reasonably immune to a destroyer attack launched at five or six thousand yards

## Electricity

An Easy Method of Mastering Wireless Operating One of the leading phonograph companies has recentjust not one at complete act of matructional is cords and books for those who such to master war less telegraphs at home. The records, together with the books arrest to train the sear to the dots and dashes of the telegraph code

Our Increasing Telephone Service The number of telephones in use in the United States at the close of the year 1917 was 11,713,228—one to every nine persons and an average of more than 200 calls for every muce woman, and child in the country were made during the The total number of employees of commercial elephone systems was 262,622 1 or the 10-year period 1907-1917 the salary and wage payments increased 157 3 per cent, the expenses and fixed charges 126 6 per cent, and the total meome 1122 per cent telephone system, together with the independent lines which are connected with it for the interchange of local and long distance service comprised 89 6 per cent of the total number of telephone installations I best facts are culled from the preliminary report of the telephone industry recunity prepared by the Bureau of the Census

Principles of Radio Communication | the Signal Corps of the United States Army is to be commended on a very excellent work which it has recently published under the title of 'The Principles Inderlying Radio Communication" or designated as Rudic Pamplifet This book contains over , 0 pages and is replete with interesting and instructive diagrams and photographs As its title implies it iteals with the scriple principles upon which radio communication is based Starting off with the simple principles of golvanic and static electricity the reader is soon led on to the clemen tary principles of wireless transcession and reception and gradually in the neitra acres of modern vacuum tube apparatus and so un The buok may be obtained from the Superintendent of Disciments Government Printing Office Washington D (

A Huge Telephone Switchboard I ha tok please quarters in the new Pennsylvania Hotel New York city occupy \$ 105 square fact of floor spine linving an operat ing toom 110 feet long by I i feet wale a terminal to me 30 feet king and 25 feet wide a rest room 23 feet by 1 feet, and a lacker and washroom 10 feet by 11 feet | I be operating force consists of one chief operator one assist ant chief operator, eight supervisors and 110 attendants The switchboard consists of 21 positions Harlices positions are equipped with telautographs used for paging and announcing bis. The switchboard his a capacity of 3 140 ratensions and 200 trunks and is equipped for 2 '00 extensions and 180 tranks | The hotel has telephone serve a man h of its 2 200 rooms and there in 40 public telephone booths second by four switch boards connected with the main switchboard. ## The Tank Man's Story

As Told to C. H. Claudy, Special Correspondent of the Scientific American in France

Y is you read a lot in newspapers about tanks. But

1) is were three bittalions of Aurice in tank reope

1) is were three bittalions of Aurice in tank recope

1) is was action one with heavy tanks with this

lightest on the with light tanks operating in the

1/2 and three sides of the tanks operating in the

1/2 at yet who is side? If No you fill have it yet some

act is to talk about the heavy tanks don't know any
thing, bout the n and don't want (i. light tanks for

no every time

Yes, I'll tell you about them if you

are interested.

are universal formulation is light one. Whippet tanks some people cell them. Weigh about war tons and have two men for a cray. East? It is faster than there is any see for them to be really. That was one of our tradities running away from are infants. No seems in having tanks that come get not found which he men they are supposed to meet 1 and blaza a trul fort. Those little formulation are supplying a spelt rules and hour over

sood ground and infacts in bicks of it goes two!

What Oli one of them is the engineer and the other the plot. Some of the tanks have machine guas and some one-pounders only one gun to a tank you know those lettle follows areast buttledings We started in with 20 tanks. They core should \$10,000 each 1/s motor not unlike a good automobile motor four-excluder bount to hoose-power. Indeed the tank has a let of automobile motor motor of the good and the started in the sta

out of lurk sure: brisken legs: You know, or masted ribs:

No the Buche and tank, gun inverburts in a modular
to anything.

Not of a bullet, but unless it strikes sharp
at right angles it doesn tgo through. Pretty hard
steel, you know, that tank armor. What did stop us,
when we were stoppied was the 77. Fvon that took a
direct that A 77 could go off right beside us and we d
andly know. It But if it made a direct the well, you
don't expect to run a war without any casualties, of
off all the armountation in the total. The tank two scraps
steel and the man-well, we found a hand, and a shoe
lust iterally blown to nothing.

'Terrain' Of course there are places a tank can't go

bott read a lot about how a tank loves mud. Don't you believe it A tank can sither around in mud just like an automobile. Of course it can it into it is an automobile of course it can it is just it can telimb at the same angle on mud as on dri, zeround and soembow we always the fight in the mud. I make it is a great place for mud if you could sell it Pian't is useful thave any mutual sleft at all. Mud didn't stop us of course but it mach it much difficult. On dry ground we can climb 45 degrees, and 51 degrees in reverse.

You how a lot about the way, tank can crawl over tennthes. But that a the big heavy tank. The little fillow can I run over a trench the way it can down and up a shell crater. The Renault is tail he avy, you see It gots its nose across a trench all right but if the trench

Head protection worn by tank gunners when looking through the sighting slits

is a little too wide the beavy toil drops back into it. Then you have to get out and dug or get another tank to come and pull you out. This why two tanks to gether are worth four spiritely. They can jam themselves up and still get long by doing the bother at with chains. Once that I know of a tank got stuck and the second dank routin is pull it out. So the officer outside agands sincher tank and it comes up—all officers of them pull the helpless out up and over. He got two of them pull the helpless out up and over. He got the D. S. C for it, that officer.

oner dutate agrats another tank and reoms upthe sude firs, mind—and he hooks that on, too, and the two of them pall the helpiese one up and over He get the D \ \cdot \text{C} for the helpiese one up and over He get to a cancer when you're talked you know As long is a cancer when you're talked you know As long you can move around, the 77 has a hard time getting you can move around, the 77 has a hard time getting you have the part of the substantial time getting you have the part of the substantial time getting to the part of the part of the substantial time getting to the part of the pa why we were so anxious to have self-starters put on the American tanks when we thought we were going to have merican tanks. If there had been any self-starters on our Renaults, wed probably be sky about twenty counties. Engine stalls, Boche gets busy, chap made struggles with a crank, takes time, 77 lands, signal back for a reserve tank to come on into action. No, they ddnt t put the self-starters on Don't sak me why, I don't know

"Sure, the American tanks were good tanks We never used them na etton that I know of Those I saw got to France, or got where they might have been used, after the Armstate. But they were sure American all over—too much American, if you know what I mean It's a national failing, I guess, the business of being ungenious. There was so much impenuity about those instance, machine guin belts. When you use them, they are rolled up and in a carrier. Some sure task builder to be in carriers, rolled up ready for use. When he got through there want any room mastle for the crew No sense to it, of curres, the same amount of aminumition stores fair, and leaves pleasy of mom and it only takes of the control of the crew pleasy of mom and it only takes

a few seconds to roll up a belt and put it in a carrier. Then there was the compass Sume one must have read that British tanks carried compasses. So they did, until the tank crew could throw it sway. So our American tanks came over with the handsomest compasses made you crea saw, regular ship affairs, gimbles and all! Now of course, that a sill foolishness. In the first place there wasn trom for the compass and the erw. In the second place, when you start the engine, the compass And if it was, there wouldn't be any sense in compass. And if it was, there wouldn't be any sense in that sell you justed, not to mention a few officers with flags telling you where to go, if they are not sitting on top going with you.

going with you may the speedometer. Why any one should imagine a tank crew needed a speedometer I don't know. But there it was, ready to tell us just how fast we were going Maybe they thought, down in Washington, we were going to establish a tank speed record or something.

The new technique for mounting fossil skeletons. One side of the exhibit shows the skeleton itself, the other indicates what the living animal looked like

## Fossil Deposits of Nebraska

## What Geology Tells Us of the Prehistoric Fauna of the Plains

THAT the largest fossil deposits in the world are found in the Agate Spring Quarries of northwestern Nemasks as fact known to probably very few people out side of those directly concerned in the fossil business or more properly spacking those technically inferested in natural history. To Capt James H Cook and his son Hardol J Cook, of Agate, Neb, we are indebted for this discovery and subsequent development of these quarries through which a very considerable portion of the knowledge of the fauna of this hemisphere in prehistoric times have been derived. has been derived

Captain Cook went to Nebraska in the early seventics Captain vois went to restrain in the early seventus with a party of hunters, the country then was a hunter parame, the bison, roaming unrestricted over the prairies and other large game were in abundance Realising the possibilities of the land for agricultural and cattle-rasing purposes, he staked out a claim and settled where now as the well-known Agate Spring Ranch Captain Cook was not merely a hunter he was a scholar and scalous student of science The fossil bones that he discovered on his land he realised were of great value to

discovered on his land he realized were of great value to students of placionitology wheahugton was notified of these first the students of the students of the students to come and myseligate. The University of Nobraska first took up the work; under the direction of the state goologate, I. B Rarbour, the whole section was ther-oughly explored and many fossil bones removed. Later Captana (Dock) son, Harold J Cook went to Glumbia

University and took a post-graduate course in paleontology While in New York he succeeded in interesting the American Mu-seum of Natural History in these rich fossil deposits and, in response to his in-vitation, they went to Nebraska to explore Since the time of their

first visit they have been actively engaged in pros-pecting and removing specipecting and removing already means at one time, by the second of the sec ns At one time, by mens widely spread epitable caused the animals of rack to the water of the Nio-brara and there in vast ara and there in vast mbers they died and re buried in the sand d down by fi

That they were all covered at the same time is evident

Hast they were all cowesed at the same time is evident from the layer of sand in which they are found. The specimin so obtained from this run represent a large variety of animals of the lower Miveno and upper Oligocene periods. Here has been found a complete sketten of the giant Dinchyus or graving uf the lower Miocene. This animal was most formulable in appear ance, hung as or more feet in hight and with canness that formed stout and heavy tusks. The head was that formed stout and heavy tusks. The head was very long and was made very grots squt in appearance by large bony growths on the skull and jaws. For a pig the legs were very long and gave the animal a stilled look. Another complict ackeletin found is that of Moropus, the clawed borse, already described in these c dumns than

which a nore grotesque creature could hardly be imagined. This maintail lived in the lower Moorn: It was larger in bulk and stature than a large horse had a long neck and rather small horse-like head. The fore limbs wer long and the hind legs much shorter giving the animal a steep inclination from the shoulders to the rump a steep in imaxion from the so unders to the running.

The fest were armed with great class. Almost nothing is known of the habits of this queer beast but judging from the character of the teeth nock and fore legs it is reasonable to infer that it fed on the leaves of trees.

By far the most numerous of all the forsula found in the Agate Spring Quarries are these of the Discreticinum or pared-horn of theorems of the lower blue ene and upper Oligou ne upoths. They were different from all other thinsercoses in having a transverse pair of horns on the

nose in all subsequent two horned species the horns were nose in air vilos quem i wo mornet species the mains were one behind the (ther. These minist were very small not more than half the size of the prisent day Aliacan variety. The is impairing, cuts show the complete skeleton of one of these small animals and also the animal as restored from the skeleton by J. D. Liggins, Director of the Colorado Museum of Natural History, at Denver

This method of exhibition originated by Mr Liggins marks an innovation in fossil display. The two cuts show the two sides of the same exhibit one side shows the animal as it appeared in life, and the other shows the assembled skeleton occupying its exact relative position in the hollow interior of a longitudinal half of the restored animal. This new method of skeleton mounting is now on exhibition in the Colorado Museum. There also may be seen a slab of rock four and a half by six feet in size taken from these same quarries just as it occurred in the formations and showing the fossil hones in high relief

an algorithm. Although promiscuous prospecting for fossils on the land owned by Captian Cook and his son is not allowed they not only printipeople of recognized authority in the realm of paleonted say to take away all the material wanted but such people are most cordually invited by them and treated with the utmost courtesy while them. and given every possible assistance in the work of reinoving specimens. Although most of this work has been done by the American Museum of Natural History

of hew York city many others have been actively interested and have taken away valuable material, notably the Carnegie Mu neum under the direction of O A Leterson, and the University of Nebraska under Barbeur as already mentioned

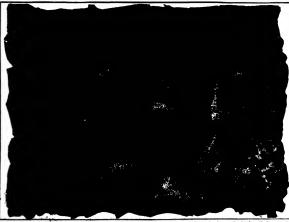

## German Glass "Film" for Motion Pictures

In is reported that a new method for producing motion pictures by prejection through a glass film (as distinguished from the usual commercial film of celluloid), has been werled out by the management of the famous optual glass works located at Josa Germany

This new glass film has the idvantage of being aly one one hun-dredth is large as the film

now in use

This so-called glass' film"
is in reality a very thin
plate of glass upon which
the necessary number of prints are made and which is shifted mechanically be-fore the are It is not known whether this method of projection is in commercul use

Nebruska fessile in sita, the rock having been chiscled away to show the bones in high relief

## Our Marked Highways

## How Their Marks Have Led and Misled the Innocent Tourist By Avia Gordon Vestal

I have not then 9 000 andes of touring I I have not a the requirement of all of the first of the first transformations, refer to the little for the first transformation, refer to the first transformation of the with less to this is to all these I base at the st milit accessors to fell w west in left face wastate. Hineas when vesting places tway from the more lacks

After all this experience. I must own that I to I no re or I so maluard to puse up the traditional I used attention receives good

not retrieved to self action of receiving seed that and point and it repring them according to whiter the strong rian follow them with some indeed where he wand while he is going, or whether he can only specialty or those points. In other words there are marked reads and there are unmarked rough the matter further among the innived much their are 1 indeed what are including with smarked and their nare wise should be are intelligently marked and there are roots which as not there are ruds who have marke becoming usly and rouds which are marked but internationals ranks on which the marks its maint and and raids on

which they are u.t. In michiefered me temmes frequent halts to The machineered mass is possible to often these ask lacel residents to point the path. Toe often these ask lacel residents we wan lawned directions or vogue and rado-sing. We soon learned that it was the part of wisdom task at least two different and number and then to see hat had for a deciding vote informants and then to seed or than I for a deciding vate. But one often is quice a signal when no human is within

As I see it it is in resignation of this state of iffanthat certain accepted motor routes between the several actions of our country have been dignified with one It is in further recognition of the necessary for keeping the tourist straight in his tennings that a distinctive symbol has been adopted for each of these trails and that this symbol has been in or or less systematically and more this symbol has be it in ore or less systematically and more or less to support in 19th and it more or less to support in 19th and it more or less to support in 19th and it more partial on a thilliance points at a unique the partial on the lightest partial on the property of the state of the sure of the s

and steep hills he the and wester of some western regions, tla tenderfoot iven the subber the tenderfoot can without blazoned trails casely add to losing himself the perils of finding ne water no rench in gange

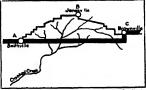

Named and murked reates are still young in most parts of the Inited States with their blid ding powers they couple certain chronic wishnesses I ven the best have their ninging links Too often reads one designated are neglected until the nurkers to come illegible or arm poles are set which do not collect then inheritance of syndiols. Some times there are interludes of miles where I was mutative hos not yet Iten aroused to do its but Some times to all riv dras between towns have resulted in painting in authorize falterentive ionforwith ant proper placards at the punc tum to rade its their true char actor tiller mean little com-petitions have led the citizens of some prinate community to destroy them or move them across to their pet branch of the

breeting 1,500 signs along the Lincoln Highway between Omaha and Sait Lake

read. A source of orror in the 1 i West is the fenting in of man open grazing bands through which the trail fumerly meandered. Another wakness cames in the setting up of new crossroads after the marking p bern through making coincis with contine because

he general the trail in essect fall w through the

wonderfully clear sign indicating when and why to take the detour that avoids the waterways

country than in the tawns tr songs are fewer if all countrs are marked one can menge without markers electric the take the thought the reasoning, t pick in a symich mark and then to indicate that one is on the right trait. Where paint de poles are lacking a thoughtful farmer will sumstimes paint the highway markers on his fine posts or mail box or even on his sil.

As most highways make frequest angles one can

never be certain, in the absence of a mark, that his proper course at any corner hee strught sheed, even though he knows that to be his ultimate direction. I have seen more than one encarceasts with a single pole eastly at the corner. Does this neun straight shead or terri. Even two plots may be set ambiguously. The place of more than a single shear of the strught of an arrow or a hard, or the setting of more but close enough to be varied from the close enough to be varied from the vices enough to be varied from the word reserve the difficulty here.

A symbol painted too low will be overgrown with woods in the annary Worsen's tract along the Cannon Ball Truil. Poles originally marked with black bell and Cast ground and been treet. In their new positions the marks were as triadly half burned, difficult to find when the ground was been and quite out of sight when there was any grass.

Bait Lake On the straightaway course through the country one must slow down at every corner to read the marks and he prepared for a turn if need he Ihn could be clummated by the placing of an area about 100 and he force cash corne, to indicate that the course was not going to turn off. This arrow, or pulsays head may be painted on the position of the straight of the course was not going to turn off. This arrow, as most well as the course was not going to turn off. This arrow, as most successful to the course was not going to turn off. This arrow, as most successful to the course of t the town

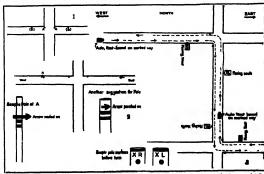

An alternative routs of real acrose when properly de ignated may become a frightful numanes when its de ignated mass heroms a frigunul numane winon in-character surp plants undusted. There may be a short and direct route across the hills and raviness between buntistile and Brownville inturequelts wooded and quite passable whin der. This shuild be the main route. The second or optional ruite follows an indreet course was Juneauly, rossing but one of the many tributaries of Crooked creek at will be asfer and really time saving when the they is suit I us make the loop a source of satisfaction rather than of disgust the replective threat for mild the run router should be indicated on the sign at the point of divergence. This might be out the vigin at the point or overgence: I am angust use done in the rive a sign that gives full particulars, or by sents such with mer of graphic representation as that shown in the vit. Presumably, if the clones is left to chance, it is a fifty-fifty split that the metorat will make the advantageous selection. But it would be hard to convince him that the odds are not about ten to one against

There is another type of trouble frequently met along the 'Black and Yellow in Wyoming The route on-sists of a winding course around an interminable series of buttes. As the land is un-

fenced, anyone can at his in-dividual whim break a new route in the hope of avoiding ruts or finding a less steep grade, ac-cordingly before nearly every cordingly before nearly every hill the winding trail splits into three or more divisions, with no indication of which one should be followed Ordinarily these branches would meet on the far side of the young mountain, but sade of the young mountain, but there is always the chance that they will actually diverse, never to meet I don't suppose it is practicable to label as ands overy detour which every motorist estab-laises through this country, but it should be practicable to label as unand those which lead no-

where

A fault that causes much confusion along the Burlington Way as
that the faceler lines are marked
identically with the main route
Furth ines, if it is felt advisable
to label them as part of the main
route at all, abbidd use the
symbol of the main hus plus come
additional distinctive mark. In
the case of Luncoin Highway
feeders the male line evanhol is

en at B B are definite (2) brings out this suggestion is How to hoop the tourist on his track

used, with an arrow penting in the proper direction, and the words "To the Lipcoln Highway " This seems to be

For convenience in night towal the palm must be warded to lows's Great Witte Way O' course of all entired routes adopted the same three-foot white band in their point, they could not be a distinguished from one mother, but enough modifications should be possible to a country. The telephone nels— \*\*

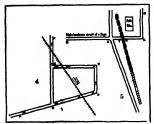

another, but enough monimisations among no parameter go around to go around. The telephone poles is the universal enzyme of highway may be a supported to the property of the discriminately without stopping to consider what these

The motorst s difficulties in driving through a town ans motorists until unless in criving through a town or city are somewhat different from the onest encountered in the open country, yet they are none the ker nal. If all towns were travered by a single business street in a single straight course the matter would be simple; nough

single straight course the matter would be simple; nough but this is far from being the sase. The routing of the trial through towns is highly individualistic and most anonying. If may pass by within sight of a town ir out of view. It may enough the muterate source may be approximately diagonal or he may be led useful may be nown and out spain in a loop paralleling his inward iours. His may even be obliged to circle around Podunk and one out again by the very road that

and orms out not state to the active that brought him in T and come out to the active the active that a consist led into an undercasary amount to the proper course. When enough them a large dresder upon our way to provide for all our purchasing needs we would fronticitly sering alternation and the proper course. When enough them are produced to the proper course to the proper course the productive the providing recognised loops, so that the long distance tourists with no interest in the villages could ride straight ahead, while the local traffic which must enter that town could use the alternative route? As an illustration of this suggestion, I show a sketch of our setual route through an imagnificant Kanasa town where we were obliged to med out of our way and times cross a rained at grade

insignments a name town wares we are outque a ride out of our way and twee cross a railroad at grade although there was an equally good street which would have taken us directly out nurway had it been so placarded that we could have found it

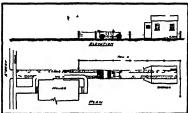

although there was an equally good street wints which have taken us directly on utway had it been so placarded that we could have found it and the second of 

In (1 is shown bow the toprist is forced by its rat tarker to make a long deter through a village when a track road it E was available in (5 the marker at \ is marker to make a long date: three direct road B E was available in (8 hidden 1) a train standing n) the cross one at \(\bar{\chi}\) as well

## Piling of (oncrete Pipes

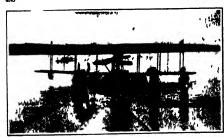

Dill's made of con rete are a new develto punnet in some questies and have been
replicing nation pages. Hay are took long
used mate of of want her pieles in the construction of
whatever in Tasmania. A Tasmanian paper reports
that the first of 600 concrete cylinders was turned. out record) the cylinders to it used to build the wharf imade the new brishwater at Burme for the accommodation of deep seasons while

at remmodation of deep at views .

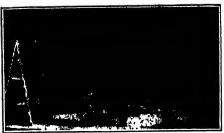

The plant has been installed in the blockyard at the harbor and the pointedings were in the nature of a trad. The comerte cylimber are 10 for though y 4 feet 0/2, not here in diameter the control being 12 mehas in thick-

lo pr duce them a steel cylmiler is placed on four wheels, and driven by an ilectric motor revolving at the rate of from 250 to 500 revolutions per minute the con-crete is thresh in and the centrifugal force thus produced gets rid of the water. It takes about a quarter of an hour from the time the mold is set in mission until the concrete cylinder is ready for removal, which is then lifted to a cylinder is mady for re moval which is then influed to a sciencing place by a rain. There is 1 min pipes can be turned out in seven minutes. The firm make down to chinch pipes and the molding cylinder is revolve at a much more rapid rate for the smaller work decreasing in spood with the increase in this size of the pipe. I obtain the necessary height in constructing the wharf the concrete epilinder will be place I on top of each other councised together and secured lev an 8 min state band on the outside at the junt. I be hollow space in the cylinders will be filled with said.

The pape company secured during October and November last orders for large quantities of court te piping. One municipality has ordered 5,400 feet for 250 pounds working per seum cold mining sompanion have ordered spring for per seuros from 150 pounds down to 50 pounds. Other orders have come in from country distings for subsect forms as the Some accountry distings for subsect forms as the Some accountry. to 30 pounds. Other orus is nav dome in from country districts for outwerts drains etc. Some excellent test results have been obtained with pipes. Two lengths of eithel pipes into intended the pipes. Two lengths of either pipes jointed together with a collist point have been tested to 300 pounds per squares such without showing any agins of leakage or sweaking.

White from hose transland the publicity of land flying Navid average in a term of suggesting such as deep represents the transland flavors mound. They have he and of Quite a key of their recognition to the first such that a deep representation of the mark attribute their recognition to under the best artificial to the street. It the greater memory however the mark and offer as a marine. Navy, then we have for the presentation of the with the Navy, then we have for such as marking to do with the contract of the same thing to do with the market for the same thing to do with the market for the same thing to do with the market for the same thing to do with the market for the same thing to do with the market for the same thing to do with the more same of markets, to these

us done how they do it such what it is done with senser less of a matter to them.

They speck at hydrophases as of are rill not knowing that a hydrophase is nothing hot a type of speed boot that loss nothing to do with Brang. What this really mean to rifer to as the hydrosurphum. He word hydrosurphum itself is more

hydroarphine itself is now obside Wake accraft reither scap mas (modified anglancs with one or two floats in place of a landing get) or flying boathe bulls with wings attached there to

The progress in water flying his been fully as rapid as that in lind flyor, the type of plones seed by the Navy has been chunging constantly and is even now undergoing rapid modden

The earliest appriments were made with land machines on floats I hese werring a float of the second 
shi amount of time as compared with other types I mally a me line was evolved which had the qualities of the land mus hine as regards bandling in the air proved satisfactory on the water, and must an ideal muchins for instruction purposes. This me lime, was adopted for elementary training and a shill used for the parpose lar even of control maneuverability and dimability in the given cutter satisfaction. It is also make the many interest satisfaction. It is unfortised in the principles of their satisfaction. It is unfortised in the many interest satisfaction. It is unfortable to obtain the principle of with material to a possible of the control of the control of the sate of the sat

wayer of any height.

A clubble positioned heaver trye of maplian was also divided for instanced between the cash parted work that the control of the contro

hard see landing. In the event of motor trouble while on a patrol the result was usually a smeathed plane and more than often a lost plane, together with the pilot and his observer.

more than often a lost plane, together with the pilot and he observer.

The frainces of this type of seaplane led to the adoption of the lost idea. Monthications were made of the T-bort hall. It was greatly enlarged and improved and remained for the British Royal Newel Alfr Service to make the first successful use of the Porte type of boost and for heavy seed out. At the times boost, having an anomonous unappears were the times to the heavy seed out. At the times boost, having as sources under the times the service of the times to the times to the times the times to 
This condition of being hard on the controls is due, of course to the carmonic sate of the controls themselves. Upon the surface presented to pressure does the case of control depend. The rudder is as large as the sail a small boat would carry. The alterons would compare in size with the wings of a small is out plane. Many

neithods have been track, and are now meeting with success, of causing the stiffness of their control. The general of the altrons with the control which provid astifactory but entailed much more manupulation of the wheel in maintaining lateral balance or when banking in turns feweral types of feiror motors that the control of the wheel in the mechanical systems. First, or entrol has proved the best It is smple, absolutely dependable and operative assity. Thus is grobably the type that well be installed on all the large flying boats.

The redute of operation of these boats as quite large. The smaller, with one motor, has I sel capacity of a little over five hours. The discover five hours of the discover five hours of the standard of the wand, but figurang the speed as 60 miles an hour and the weather conditions to be normal, thus whell allow of a continuous flight of 300 miles The larger boat, double motored, has a searches emeant finel to held a searches emeant finel to held.

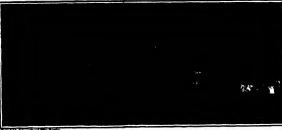

At the Boston Aviation School. Heisting a Burgoes-Dunne machine out of the water and renning it into one of the felding hangers

ame hours The larger boats are slightly faster than the motored boats and with their increased especity could he orbecth oc

Of course, continuous seldom, if ever, att But it is a comforting But it is a comforting knowl-edge to know that you have a marma of hun of miles in your gas tanks when you are a hundred or so miles at sea

These boats are flo mes a naval eraft, on principles of naviga-There is not the least

toon There as not the least bit of generous's statehole to it. Navagation as aub-port that the student await aviator cannot well afford to sugar the student await upon us in our student days is when as gound school by a Royal Naval Ar Servir-pilot, on what we may expect and what was expected of wwhen we got abroad. ## Remarkable Example of Camouflage

To the couthwest of Mont-dulier, which marks the farthest westward advance of the Germans in the last year of the war, there is a tall stone arch bridge. As this was a very complexous structure and one size to attract the attention of enemy contract the attention of enemy the structure and one size to attract the attention of enemy the said of making the bridge male complexes were given the task of making the bridge male complexes might seem. Viewed from the ground the bridge was complexed us bridge was complexed to the said of 
clothe the bridge with "grass so as to correspond with surrounding vegotation By "grass" we do not mean natural vegotation Real grass and branches were used in certain cannouflage work, but the material had to be renewed daily because of the witing of the leaves A substitute for such perhabile stuff was made of canvas and incting painted a leaf green. After the leason had been learned that the green of the artificial

'grase' must be not merely a visual match of the natural leaf green but also specifresopically the same, onemy airmon found great difficulty in distinguishing objects covered with artificial verdure in the case of the Montdidire bridge the clothing of 'grass' produced a most pretureque effect giving the structure the spearance of an inve-overed ruin.

### The "Killer" Whale

THE American Museum of Natural Hustory has recently placed on exhibition a info-mend model of a "Killer" whale or "Orea" which is one of the most feroctous animals that inhabit the sea. It will attack any living being within its reach, be it fish, flesh or fow! The animal grows between 28 and 10 feet in the control of t

their only defence u in flight! He hig gray whale is so afraid of the ores that it become paralysed when attacked. The oresa are said to be particularly fond of the tongue of the whale. A number of them will attack a gray whale, worrying it until it opens its mouth, when they will dart in and bite off its tongue. Seals, porpoises and fish are the principal food of the oreas The seal are not even as of when they are sahors, for at

Not an ivy-covered rain, but a cieverly camouflaged bridge

any moment an oros may dart out and sease them if they are near the water's edge. Birds too are captured in this way or when awnimals. In ora has even be in known to attack men who wer on clarge cake of floating is a like while repeatedly hurled itself upon the ice in its efforts to reach the min

## Drill for Boring Square and Pat-terned Holes

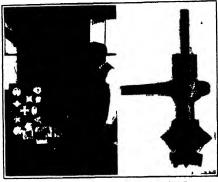

A COMMON method of borns, a square hole as wood as to have a rectangular cutter mounted on the bit so

bit into the world and rut out corners in the round hole I has is quite satis factory when working in wood of proper texture but in hard woods it is difficult to feed the rectangular out ter into the material. An inventor has recently over ing a bit with cutters that operate at right angles to the axis of the bit. These out instead of crushing their way into the wood

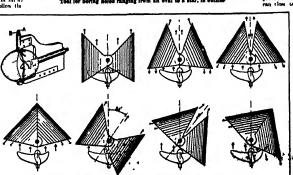

As shown in the view at the right hand side of the the right hand side of the accompanying engraving there is a cutter head mounted on the shank of the but which carries the lateral cutters. These out term are geared to the main shank is the cutter head in finaled with a handle by which it can be kept from which it can be kept from justed to any desired angle. This view shows a tool for cutting square holes and consequently a square out-ter head is used of a size

The fan-air burner used in the furnace for annealing carbon electrodes Air supply above, gas below

Tool for boring holes ranging from an eval to a star, in outline

Typical positions of the reversing radder & sheed (in per total properties and in diagram from above)
my for full speed astern (left below)
cost weareness, and for travel astern is

just large enough to hi into the hole bored by the main cutter of the bit. However other entire hands may also be used which are three sided or many uded and the cutters also may be varied in number the cutters also may be variety of pat-and form so that a wide variety of pat-ir ms may be cut, ranging froza an oval to a star in outline. In the view on the loft-hand side of the engraving are shown some of the possible forms of holes that can be cut with a bit of this type

## Reversing a Ship with the Rudder

Reversing a Ship with the Rudder THE can with what ships can but a control to the same of runn turns of mint easily consider in respectating engines, with turbines a special turbine must be installed for the purpose and the more maneuvaring power desired, the larger and more powerful and more expensive this turbine

I ven when all these arrangements have been made it is still not possible to give ships sufficient self-control under many illi unistances in which they find thousels es commonly placed. Tugs must be use I repeatedly, and the demand on those

vose is in all ports is great
in our issue of beptomber 28th last we to our seut of expinents r 28th last we showed a unique arrangement for setur-ing ny rang shifty. Instead of rever-ing ny rang shifty. Instead of rever-ing the engine in order to make the ship run backward titur, was a rudder so deigned as to these ra shout the propuler and assess the flow of water from the serve the so disctod that the ship would travil atom forement with the engine and resuming normally. A British inventor-nous noise foreast with what appears to be a more thoroughly worked out now must invani with what appears to be a more throughly worked out wrams of this sits. Instead of having he ridder it is to form of two compara turd's straight leaves which at best can only partially inclient. He servers, higher through the provides two tylindral leaves, higher through the provides two tylindral leaves, higher through the servers of the comparison of the servers of the comparison of the servers of the ser

The cas ntual parts of the rudder consist of the two curved defies tors. These are prootted at top and hottom on common on One is operated by me of a solid shaft, the o by a hollow shaft con trio with the selid By suitable mechanism

## A Car-Loader That Automatically Weighs the Load

OUR cover illustration this week illus trates an interesting system of trans-ferring materials from ship to freight car located at Locust Point in the harbor Baltimore Here there is a pier 800 f Baltimore Herr there is a pier 800 feet long, on which there are three tracks The center track is provided with a conveyor belt 30 inches wide which extends the antire length of the pier. This is driven by a motor located in an operating house at the land end of the pier. On this central track runs a loading machine and a series of hopper cars. On each side are tracks on which freight trains may be run to be loaded by the loading machine Heretofore it has been cust mary to move cars up to the loading pastion, but with the present system the loading machine travels along the line of cars and will deliver its load to any desired one. The hoppers are loaded in the usual way from vessels or lighters and they have a capacity of 20 cubic yards of material. This material is delivered as required to the conveyor belt

The loading machine is provided with 20-inch belt conveyors which pick up the material from the main conveyor belt, pass it through a weighing machine and deliver it to a loading arm which in turn delivers
it to the car The loading machine will it to the car. The loading machine will operate to load either an open or gondola car or a box car. When the loading machine has but moved to a proper position, the loading arm is introduced into the door of the car and then may be swung to any desired angle to deliver its load. The loading arm has a horisontal travel of 270 degrees and also can be moved vertically so as to be raised above the

highest open car The entire operation is under control of the operator located in a cabin on a loading machine Power is supplied to the ma chine by means of wires strung along the bulkheads, which separate the middle track from the outside tracks. The hopper cars are provided with motor drive so that they may be moved to any desired position. With this equipment, bulk maposition With this equipment, bulk ma-terials such as ores sulfur clav, coal, etc may very quickly be transferred from a vessel to a freight train. With this loading machine box cars have been loaded in ten minutes and goudols cars in less time One of the most interesting features of the system, is the electric weighing apparatus details of which were published in the SCIENTIFIC AMERICAN of August 10th

Our Navy's Bid for the Great Trans-

Atlantic Flight (Continued on page 479)

ctically the same as those given for the NC-1 However, aside from being fas these more recent boats are ren climbers, being able to make 3 000 feet in less than 10 minutes Depending on the load and other conditions, they can take off from 30 seconds to slightly over

minute It is interesting to study weights in connection with the attempted flight connection with the attempted night.
The total weight of the more recent NC
planes is about 16 000 pounds. The gas
and oil for the great flight wrights 11,500,
and the erew of five about 900 pounds.
The total useful load possible is figured at The total useful load possible is figured at about 13,000 pounds giving a gross lead of 29,500. The limitations of the load has led some Navy men to conclude that the Asores route from Newfoundland is practically the only one available, although nothing has been officially said about the The distance from Newfoundi matter The distance from revenuessage to the Asores is some 1,200 miles, while to Ireland the distance is 1,760 miles At a fair rate of speed, the flight to the Asores should take about 17 hours, while to Ireland it might take 27 hours. Now to are and it might take 27 hours. We then, the four Laberty engines require \$80 pounds of fuel an hour at crusing speed, which on the Asores course would mean about 11,050 pounds, and on the Ireland course, 17,550 pounds. For a non-stop

#### Shale Oil as a Business Proposition (Continued from page 484)

To the Trade:

sales policy assures both jobber and

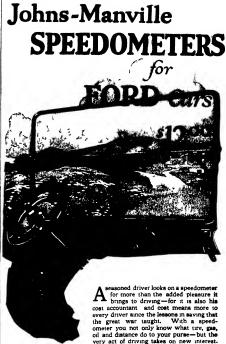

dealer real trade

protection Ask for

There will be ammonia and pot sich from the renduce And then will be other items, but as to just what they will be and how much of them will be recovered, no two authorities agree I stimates of the aggregate value of all products run as high as \$15 \$20 in one case even \$15 per ton of raw shale—and as low as \$1 per ton Cost estimates range anywhere from \$1.26 to \$10 per to \$10 per ton \$1.26 ton ton \$1.2

The shale industry has been demonstrated as to proves values and profits, in Scotland these many years but that doesn't prove anything about the United States. We do not yet know how our shale compares with Scotlands. We suspect that much of it is richer in oil but it may, be found learner in other product is that go to make up the profits. I hen mining out that may be found learner in other product is that go to make up the profits. I hen mining out for the profits in the two brought up to the surface our has to brought up to the surface ours has to be blasted out of immense cliffs. On the face of st, ours should be the cheaper process, yet our may well doubt that we shall be able materially to reduce the Scotch mining costs of 40 cents per ton, and after we get the shale out of its bed, our costs will be greater.

All this goes to show two things. It goes to show that, in the first place, the

There's a basic satisfaction in knowing where you are going, how long it will take, and how the miles are slipping by No one who has ever driven with a speedometer on his car will ever again want to drive blindly

The Johns-Manville Speedemeter is of simple and rugged construction. Mounted on a roomy instrument board of selected maple highly finished in black—sufficiently strong to permit the mounting of clock or other instruments.

The adjustable End Brackets insure a snug, sold fit to any open model Ford car A mechanically perfect device, it makes attachment easy, and is but one of many features of value which this combination Speedometer and Instrument Board adds to your car

If you have a closed body Ford ask specifically for the Sedan Model' Speedometer

testify that there is money to be made in bestify that there is money to be much in the laboratory, but the men who make it are the ones who finance the laboratory work and not those who supply the raw materials. In turn of the latter comes only when the processes developed in the only when the processes developed in the laboratory come into the general market for the use of everybody either through heens or expiration of patents Nobody is a nut to get rich because he owns oil shale lands, until after the chemists and the engineers have finished their end of the contract—and to date they have har ils begun

the second Q E D of the oil shale in lustry is that it is a big man's game
that are no gushers here that hring in
milli ns in a few weeks and there are
no liy holes that eat up the money without giving the investor a chance of return pi ps (or s game, it is not a game for the man with a home made plant working on a small scale. It is a big manufacturing proposition, involving plentiful supply of raw material, plant operation on a large scale and marketing problems. It is a prehiminaries have been closed out invest inillions to get back a reasonable return and a sure one. It is no game for the little fellow and the only place where the little fellow can get in ou it is by buying and holding shale lands until the big fell m is ready to buy him out

Another thing-shale oil is not going to Another thing—snale oil is not going to run the oil-well man out of business—at least not in this generation. The quantity of oil shake exposed on the surface and easily accessible is practically mexhaustible. There is enough in the four states nienthe control of the raw shale that can be treated for the next contury. But take the most optimistic cost figures that have been presented, and stop to reflect that to get a shale-oil production equal to one-ninth the present output of the wells would call a capital investment of \$30,000,000, while under the least favorable estimates. this production would necessitate the find-ing of \$250 000,000 We shall not get the technical problems of shale distillation wouled cut, and we shall not get our capitalists convinced of the practicability of the shale-oil business on any such scale

of the Shate-On Duminos as this for many years
I he true status of the shale industry may
be centical if we look carefully into the
attitude of the Bureau of Mines The impression seems to have got abroad that this Bureau is in a state of roaring optimism regarding the immediate prospects of the slak deposits as a millionaire factory Nothing could be further from the truth The Bureau has deliberately refrained from 1980ing reports upon the various methods new known for recovering oil from shale, simply because so little is known in this country on the subject Moreover, the Bureau, when it has had the opportunity to advise investors contemplating en-trance into this field, has always pointed out that the industry is in the experimental

age On the other hand, the Bureau is properly primistic with regard to the ultimate future of the industry. It has, through one of its engineers been lending technical assistance to the construction of small apermental plants at various points has two engineers engaged in studying the e possibilities in this country, and the Scotch industry in considerable detail The final word of the Bureau, is that

incipient boom in oil shale properties which is now under way in the West is one calculated not only to lead to considerable direct loss, but equally, through under-mining of public confidence, to serious delay in the progress of the industry

## Our Marked Highways

(Continued from page 487)
oither side of the track. In riding into
a Missouri town on the Pike's Peak Ocean-

American oil shale industry is still in the to-Oesan Highway we found that our experimental stage. Now there are a lot of American manufacturers who will for natives to be abroad, so, mindful of the usual amail-town custom, we yearbured to turn tothe left and drive through the village along the man street Finding ao guid, marks to be picked up when we got out of town, on the other and, however, we returned and there was our original course plain as day, to the right and across the railroad tracks When we were there the first time a long freight train had been halted at just the right spot to hide the marker beyond A marker close to the track on our side would have obviated the difficulty

#### The Seagull Flies (Continued from page 489)

There is another very important member of this aerial ships crew The observer sitting in the little cockpit in the very nose of the plane, surrounded with all manner of strange looking instruments, has quite a few duties to attend. He is a radio operator and can send and receive radio messages to and from his station on shore He makes known his position from time to time and reports mivthing sighted interesting or suspicious nature. It is he who trains the bomb sight on the enemy submarine the sight automatically indi cating to the assistant pilot behind, the proper moment to release his bombs proper moment to release his bombs. In some cases he has a Lewis gun or a Davis non-recoil gun combined with a Lewis gun tracer mounted on the scarf-ring around his cock-pit This latter contrivance is very ske splashes in the water about the target make splasnes in the water about sue target, and indicate when the gun is pointed directly on the target for a direct hit. When the Lawis gun builtet are hitting the target the Davis gun is discharged and a fair-sized shell finishes the job. This combination doubtless accounted for quite a few

German subs The big factor of all aircraft is the motor The big factor of all aircraft is the motor. In the event of moto trouble the land file is always assured of a place to land. He may land in a tree or in a plowed field, but he usually comes out of it all right. His worries are over when his feet touch the ground. The may all fire it has another element to contend with the sea. Even the different took of the different head with the sea. element to contend with the see Even if he does not crash on landing in a rough sea the prospect of diriting about, pitching and tossing for hours perhaps days, is not one to look forward to with any amount of pleasure A flying boat on the water does not make an object easily seen or distinguished, expocally if a sea is running Ihe chances of boing picked up, if far at sea, are prefix slim. The chances were son, are pretty slim. The chances were much better in the submarine sone abroad than in home waters Submarine patrol was far more risky on the American coast then far more risky on the America.

The submarine sone fairly swarmed with craft

At home

marine sone fairly swarmed with erats hunting for the Bothe serpent At home the ships were few and far between Many tales are told of long drifts in awreked plane before reseue eams about It is nothing like drifting in an open boat The open bust as at least designed to withstand a sea the flying boat bull is not the state of the Its one-eighth-inch planking does not held together long, especially if subjected to a bad landing. The water soon finds its way into the cock pit for the filers to slock around in until rescued. It is usually the airfilled wings that keep the wreck affoat

These pages could be filled with tales of naval pilots drifting helplessly at sea for hours and days until picked up by a steamer nours and days until picked up by a steamer or subnarran chaser. In many cases the pilots were obliged, on being picked up in southern waters, to take involuntary trips to the north, or vice versa. They would be taken perhaps thousands of miles from their home station, not being able to get their home station, not being and to get usabore until the next point of embatkation was touched by the boat I remember one case in which so many of these ocean trips were figured in by the same pilot that a suspicion was raised on his station as to whether he did not take a keen enjoyment in these imprompts ocean voyages and used them to vary the monotony a naval aviator's existence

There is no sarcasm in that expression the naval aviator's life is indeed inonoto nous even his flights do not give the thrill that is supposed to go with flying for hours in a grey void if the weather is loggy or misty, the water scarcely discernable and only distinguished by the breaking crests of white caps If the weather is fine the horison ought to be and the grey merges into the greenish-blue of the ocean Sel-dom are the days when the line of the horison is clear and sharp. About the most interesting things to the pilot are his instruments arrayed on the dash before

A passing ship breaks the deadly same-A passing sinp breaks the deadly same-ness Flying low you survey the deck and peek into the port holes. The crew and passengers rush up from below and wave you a greeting. Great is the temptation you a greeting Groat is the temptation of a forced landing and the ensuing ocean

Or you come upon a convoy starting Then, indeed, you have something to look at There is something, enough to still the most sluggish spirit, in the spectacle of ten or fifteen transports fringed about with bristling cruisers and with destroyers darting about like minnows playing around a school of larger fish Each craft leaves and fading into green again. The convoy has its special detail of many planes and 'blimps" Their eyes will take care to a sinking in the face of all this protection We are out for the raiding sub that prowls up and down the coast looking for no par-ticular prey but destroying anything that could be called a ship and having for an object the terrorizing and weakening of the morals of the people at home

True it is, few are the subs you do sight Your heart gives a thump as you sight your first one Carefully you steal upon it and already you see headlines in the newspaper and a-war decoration he would dive and wonder why he does not ne would dive and wonder why he does not tall the st make an attempt to escape. Now you are on it, one well-placed bomb will do it. But wait, not so fast. See those markings Disgustedly you swing back to your course Instead of detorations you see headlines and disgrace for sinking one of your own submarines

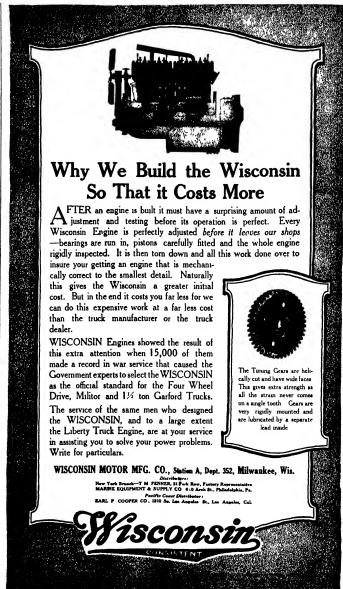

But even though you do not sight enemy undersea craft, they may have sighted you while they were in the very act of creeping upon their unsuspecting victim Your very presence has averted a sinking How often did the entry appear in a cap-tured submarine's log "Hostile aircraft tured submarine's log "Ho sighted Forced to submerge

## Recent Novelties in Public Speaking

(Continued from page 489)

cable, and all the wiring leads to a central point where the necessary connections can be made Thus a speaker either on one of Thus a speaker either on one of the stands on Victory Way or in an air-plane several thousand feet aloft, can address the thousands of porsons gathered along the avenue, through the battery of

loud speakers
Vacuum-tube amplifiers figure largely in the operation of such a vast number of loud-speaking telephones Each amplifier unit is nothing more than an incande lamp of very much the same design as those used for illumination, but is provided with two or more electrodes inserted in the bulb along with the filament Such an arrangement constitutes a very delicate electrical relay, that is to say, a very weak electric current may be used to modulate or affect a far more powerful current, thus building up any weak current to any desired strength. In fact, such amplifiers are used in long-distance telephony, one amplifier being employed for every 500 miles of transmission. By passing a weak current through one amplifier circuit, and permitting that are uit to affect a second

### Fffects of Attachments on Quality of Work and on the Draft of Plows (( mitinued from page 490)

There are few times when a plow either alking sulky or gang should be used utlout the jointer It is deudedly essary in plowing sod Some farmers be gained the impression that a rolling litter takes the place of the jointer. If the new the place of the jointer it is an it and cannot do what the jointer is a decided by in turning under trash it effectually it vants the growth of grass between furew shees and it leaves the ground in irr w sinces and it leaves the ground in Ital condition for other tillage tools one claim that the use of the jointer saves e harrowing In addition to these uefits it decreases the draft, as the Lures show

Various types of outters are used on wilking plows They all assist in making lean cut furrow bank possible and the of many of them results in decreased

s of many of them results in decreased traft. I he rolling coulter is most generally at lon sulky and gang plows. Although the figures herewith given show that it in reas a the draft its use in cleanly sutting for the furrow shee and in cutting through trash overcomes any disadvantage due to kerneter draft. Manufactures of plows invest invariably equip their sulky plows the sulky of the sulky plows the sulky of the sulky plows in the sulky of the sulky

to ust, which in turn affects a third circuit and so on, the weak current can be made do moditate aloud-pasking telephone in unto almost any magnitude. Come coulter, and the combination coulter and microil averty amplifiers are on regular construction of the day of the coulter, and the combination coulter and the amplifiers are on regular construction of the day of a subly piber East series in the average of 10 sects. To the inegablorhood of 1000,000 times 10 in the layman if in practically impossible to of 40 tests. The tests were all made in of 40 tests The tests were all made in clay learn soil which was covered with rank growth of timothy All condition were made as uniform as possible Th figures represent the total pull in pounds. Not all furrows were of exactly the sam Not all surrows were of exactly use sain size In order to have results comparable therefore it was necessary to reduce a pulls to pounds per aquare inch of furrow slice that is the total pull divided by the cross sectional area of the furrow. The figure was then used in connection with a pure was the pure was th

common furrow eight inches deep and 14 inches wide in order to have all pull-comparable The average furrow cut was approximately of these dimensions EFFECT OF ATTACHMENTS ON THE DRAFT OF A SULKY PLOW

### The Manufacture of Carbon Electrodes (Continued from page 492)

stances precedes this step. The mixed material is then pressed, sometimes in ex-tremely powerful presses to the size and shape desired in the finished electrode. There follows a haking or rosating of some surt to drive off the volatile elements and reduce the mass to the carbon form sought

Although amorphous carbon elec have for some time been obtainable from non (a rman sources, their manufacture has presented some few difficulties. In order to avoid ruinous local stresses, the work calls for extremely uniform tempers tures throughout the heating chamber, tures throughout the heating chamber, temperatures varying from 450 to 600 degrees cantigrade and these must be maintained for such long periods and with such accuracy that the use of any other than a gaseous fuel se out of the question. We have been shown a furnace developed for this work by a leading Britain firm of heat engineers. This furnace is installed in a large Midlands steedwork, with an output of 30,000 tons of electric steel ner very 11 as constructed of a steel ner very 11 as constructed of

steel per year It is constructed of a special refractory material with walls nine inches thick, bound by channel irons and tie rods The heating chamber is designed to accommodate six electrodes at a time of any size up to 22 inches in diameter. The top of the furnace, or cover-plate, is of of box section and serves as a preheater for the arr supply taken in by the burners The latter as will be seen in our illus-tration, are of the fan-air type, for consum-

ing town gas at a slight supplementary air pressure of about six inches water column It will be seen that the mossie, the part that in any type of burner requires most fre-quent renewal, is formed of a refractory quent renewal, as formed of a refractory block, which can be easily and cheapily replaced Each of the six butners at-tached to the furnace has a 1½-ino has supply pipe and a 2½-ino har supply, separate main controls being provided for both gas and ax, while the permanent sir rate of the butners can be adjusted by the permanent of the regulating plug manufacture of the permanent of the permanent sir the furnace firms into combustion shows is used it should be the jointer, except Three burners are placed at each side of mider numsual conditions. The ideal combination is the coultries and jointer These may be used as separate limited in the properties of the heating the same desired in the properties of the heating the same desired in connection with tractor plews, but is used in the properties of the prop

# "Can you guess who I am?"

How World-encircling Steamship Companies make sure of Scientific Lubrication ~ ~ ~

"AN you guess who I am?" The vister was the first man to come over the side of a tramp steamer which recently stopped at Buenos Aires

The engineer replied, "I haven't met you before But if I were to make a guess from my experience in the world's principal ports I should say you are a Vacuum Oil Company Representative"

He was right

Steamship companies lay great stress upon securing correct lubricants of guaranteed uniformity at all ports of call

To meet this world need, the Vacuum Oil Company maintains stocks of Gargoyle Lubricants at every port of importance on the globe The steamship owner knows that Gargovle I ubricants he secures at Delagoa Bay, Bilhao, Hong-Kong or Dundee will be identical with those he started out with from his home port

Gargoyle Lubricants for marine use include all lubricants for gas and steam engines, Diesel engines, dynamos, truthines, propeller shafts, bearings and other lubricating needs. To these are added such specialties as Gargoyle Storm Oil to quiet stormy waves and Gargoyle Vaclite, a solid fuel which gives a smokeless and odorless white flame in the ship's bunker lamps.

The world-wide supremacy of these Gargovie Lubricants and specialties is absolute And—The work must go on

# A Positively Defined **Price Policy**

# DIAMONDT

ATCHFUL waiting" will not avail the man who is postponing his truck purchase for a rumored drop in prices. To be sure of our own final statement on this point, we have carefully canvassed the materials and labor situation—our policy is fixed, and it is phraseable in this way. We will guarantee current Diamond T prices on the present models for the balance of this year.

If, by some unforeseen trend of market conditions Diamond T Prices can be reduced at any time during the year, every 1919 purchaser of "The Nation's Freight Car" will be rebated the difference by check

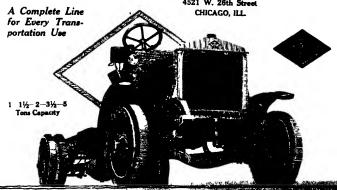

Lette 112 in 18th free 21 be pe page 1414 emperation

But, should the cost of production compel an increase, in spite of our present estimate, that increase will only apply on such orders as are taken after the price change becomes effective.

Buyers of Diamond T Trucks are thus guaranteed Diamond T's lowest 1919 prices.

For awhile, immediate deliveries of Diamond T s will be possible. With all price uncertainties removed, there is every reason for cutting your haulage costs and boosting profits with Diamond T-NOW. If you're not sure about our dealer's location, address

# Wiping Out the Fear that Fetters Production

FEAR of Accident binds thousands of good workmen to small production schedules.

Manufacturers cannot reach their greatest production possibilities while workers have to spend much of their time in guarding limbs, lives and products from avoidable dangers

# Make Speed Safer and Surer

Now, while our great reconstruction program is demanding *greater production*, you must bend every effort to greater haste and to less waste.

Benjamin Industrial Lighting banishes the dangers of darkness. It protects men, machines and material. It is helping to reduce the 125,000 accidents traceable annually to incorrect lighting.

Benjamin Punch Press Safety Devices, Benjamin Industrial Signals and other Benjamin Products are also driving out many other faults and fears from hundreds of well known American factories. Ask for the facts.

The first vessel to use steam in crossing the Atlantic, contrasted with one of the typical ocean giants of today

### The Pioneer of the Trans-Atlantic Liner By Robert G. Skerrett

By Robert G. Skerrett

W HILE the blue ribbon of trans Atlantic possenger
flag, credit, neverthicles, for others, the relation of the relation of the relation of the relation of the relation to between the United Vistees and Europe belongs to America One budnered years age on the 24th of May, the steamer Savannah rikared Tybee Ge, and started upon her memorable voyage to Liver pool it was the ambition of her owners to establish a fast line between the port of Vavannah and Tragland and by qualifying relance upon the changeful winds to make it practicable through the ageincy of steam machinery, to forge steadily onward despite calms or opposing galles

opposing gales
That radically ambitious scheme was the outcome of
the steadily widening scope of our domestic steamboats That radically ambitious scheme was the outcome of the steadily widening scope of our domests of steamboats which traversed the land-locked reaches of our invers or the schelered waters of some of our lakes and sounds it was also promoted by the local pride of certam Savan-nah shipowners, Mears Searborough and Isaacs, who ballewed that, through the adoption of steam they might outstrip New York in the field of foreign trade The man directly responsible for this courageous vonture was man dreedy responsible for this courageous voture was Capit Moses Rogers, a Connecticut mariner of repute who had become familiar with the engine affeat by association with the steamboat undertakings of Robert Fulson and John Stevens He it was who induced the Savannah shipowners to buy the vessel when she was nearly ready for launching and to fit her with auxiliary

The "Savannah" was built in New York at the yard The "flavannah" was built in New York at the yard of Crocker and Frieckt, and was planned to be a full-rigged ship. The sprint of her was unchanged with the exception of stepping her manimate somewhat farther aft in order to provide space amidality for the installing of the bolizes and engine and for the stowage of ocal The flushing arrangments were for 75 tons of ocal and cor-cords of kindling wood. It was bettered that these

ould suffice to carry the vessel a ross the Atlantic and would suffice to carry the vesset a ross the extended as evidenced how little general information was available a century ago concerning coal consumption. In fact as late as 1844 data furnashed by McCoregor lard the founder of the famous Birkenhead firm informed a commuttee of the House of Commons that engine so fless committee or no rouse of Commons that engines of less than 120 horse-power would riquir 105 pounds of roal per horse-power per hour At that rate the Savannah should have had a steaming radius of about 175 hours or a little more than seven days but she fell a good deal short of this

around so a inter mer chain seven days but her a good deal short of the again I util by Nephen Vall at the Special Vall I now Works, near Morratown N. I was rated at 80 horse-power and was 1 the nelined direct acting low-pressure type, with a cylinder having a diameter of 60 makes and a artick of five feet. The principal stumbing block to outfitting the craft was the boilers of which she carried two Those actually laced in the vessed were constructed by Daniel Dod of lize both, N. J and were not accepted until after a craft other had been rejected. Contingoraneous rate special, that the steam generators were to work at full support, the steam generators were to work at full named by a mercury page. While the log of the "Savanush in nowhere tetla how fast she was able to run under her engine alone it was reported in one of the New York, payer in the later part of March of 1819 that, during a steam trial in that port decoursed the title of the covered a total distance of 10 miles both with and against the titles in a interval of I hour and 50 minutes of the covered a total distance of 10 miles both with and against the title in an interval of I hour and 50 minutes of the covered a total distance of the covered a total distance of 10 miles both with and against the title man, the shape here eight days out from

On the other hand, the ship when eight days out from Savannah and bound for Laverpool was spoken by a sailing vessel, which reported that the steamer at that

time was making between nine and 10 knots an hour-she was probably using both steam and sail On the 28th of March, 1819 the Savannah left New York for Savanash, and after a stop at Charleston S C, she reached her destination on the 6th of April During her trip southward she was under steam for a total period of  $41^{4}_{2}$  h urs—her longest interval of continuous steaming leng 17 hours—Shutti wifer leaving Sanly Ho k behin I the wind became somewhat fresh and it was found advisable tunsly her paddle whoels These wheels were so arrange I that they could be folded rough for their employm it. I kin in the six sast to rough for their employm it. The operation of getting them over the siles or taking them imboard required something like half an hour

The Savannah was intended to carry both freight The Savannah was intented to earry both freight and passengers. Let the accommodation of the latter her cubin space was livided into three salioons and those were hardened; furnished with imported carpets curtains and hangings and were decorated with mirrors. She boasted in all of 32 borths cach of which was a stater som that arrangement being something of a departure in passenger ships

parties in possession ships

The Savannah remained at Savannah for some weeks attracting a great deal of attention the while and being visited by Pirasdent Monree who reconsisted the belief that the government would ultimately buy and equip her as a mayd vissed. On the 22 of May 1819 the ship dropped down off lyber but owing to majorarish with a ship conditions shi did not just to sea until two days later. This with starting in the beaded boldly mit the Atlantic and straightenid out upon the northern course which was to carry her across to Liver pool. Her log which is in the U.S. National Museum gives the following particulars of her periods of steaming during her voyage to Furopa

# International Trademark Registrations

All I R wating nearly near very we us at back to review nount of the brackets of the Pen American Trademask C avoiding. It now be comes possible for American class us to obtain a regarding and under the single reported in to as use trademark protection in all those countries of the Northern Group which lawer ratified the C mystelium Besalts the Luited States those countries are thus the Seales the Dominiscan Republic Hondures Normagus Costa Rus Guatemals and Paname

Unfortunately the benefits do not extend to the onthern Group of countries because of the delay in the ritification of the Conventi it by the South American states. It is also to be repetted that the normany h gislation has not been cauch I in the t inted States to permit the registration in the contro of all trademarks uguitred in the International Bureau le citirens of other country now members it the Convention brings up the same old question frecipiocity which our international patent and tradmirk attorneys find presented to them in the 10 st awkward forms. The funtion of reciprocity adopt d lev the legislators at Washington weans to be that the other follow has got to recipiocate first and their when we get good and ready we will reciprocate | his works fairly well when emidoved on one side mily but when both sides adopt if or when one side gets the I waiting for the other to act there is likely to be some embarrassment. This is felt not only in connection with the rights of Americans to the full benefits of the Pan-American Convention.

because of the inordinate delays in granting full and responded rights to the citizens of the other countries with a have ratified the Convention, but it operates equally in connection with our failure effectually to responsite in other patent and trademark matters

reciprosed in 10 forth privates and consequent attention of the Probably the most harvening of cutomone a with reference to the greating of extensions of these for the highest at our fractionary cases and for the payment of fees where the deleyes have been essent of the payment for either the other leading countries are greating such extensions freely with of ourse the expectation of compressity, and these extensions have been presented as the contract of the payment of the direction of nearly sating these contractors from the annuling fitting of the law it is feared that the one-model "reciprosety lear tofore extended to us abroad will be write-drawn of course retrieval to the sating these contractors of the payment 
Congress must eventually be brought to realise that, to safeguard our patent and tradomark rights, it to safeguard our patent and tradomark rights, it universary not me dy to ease it has which will afford unbeated by the best between the contrary, but his was the hall inflord substantial protection for the rights of foreigness her. Only in this way can our citatent hope to obtain in turn the fullest protection abroad. It is to be hoped that the education of Congress upon the point will not have to be purchased at the price of here y have in have read in price of here y have in have read in price.

### Phantom Limbs

THE RI AT A PARTIAL WHEN THE TOPICS WHICH SOME THE RE CHOOK OF ANY THE PROPERTY OF THE PROPERT

We find this artist noteworthy though not for the reason that potentially proqued its publication. The indicate field of war has lately involved the mutilation of thiman beings on an improved inted scale. Now it we a fact perhaps unformine to the average reader, that the illisons of phantom hims. In borrow a folloution co-pression from Dr. Werr Wittchell - far from being rare or vectorized is sulmost may read among persons who have undergone an amputation. Among 80 cases including a greaty variety of amputations. Mitchell found only four in which there had never been an illusion of this ham. Illustrate it is a mutter of some interest, not that it single example of the phenomenon has recently leave in practice in a sangle publication, but that the popular magaziness and the in wepspers are not at this juint time full of simular stories.

Can it lie that one of the personnal "novelties of science has at last remaind to be novel? Just how familiar is the subject of plantom limbs to the public at large? Just how familiar is it to medical men who have not made a special study of nervous phenomena?

One of the best discussions of the topic is that gives by Wir Mithell in his book 'lajures of Nerves,' published in 1872 The literature however, goes back to the satteenth centure when the phenomenon was well desemble by Ambrous. Park In recent times Dr. Charcot has given some prominence to the subject Whoever ears to pursue the matter will find fairly good bibliographics appunds in two destoral theses of the Para Faculty of Meditime one by Augusta Armdel, published in 1898 and the other by C Gulbenkian, published in 1892.

The fact that a great deal has been written on this subject does not, by any means, imply that it as widely familiar. Nastly every one of the accumulate topics that are continually crupping up as 'novelties' in the press can boast of a voluntamen, streature

We confess to being consumed with currouty to know why the great war has not brought forth a flood of stories concerning pains and other sensations in missing limbs

A Fraining Course in Public Health Administra tion -In order to enable busy public health officials from various parts of the country to come into contact with American leaders in metters relating to public health and acquire valuable mw ideas is lenef practical training course in public he ith administration is to be given in New York City this spring under the suspices of the New York Academy of Medicine and the New tork Bureau of Municipal Research | the course will cover a period of an weeks beginning April 10th The first three works will be devoted to ke tue-conferences conducted by experts of natural reputation and the work and institutions in and about New York (ity Attendance during the second half of the course will be optional Applications for our diment may be sent to Dr Carl F McCombs Buresn of Municipal Research 261 Broadway New York ( its | 1 lic present plan is to limit enrollments to 50, and t give first consideration to those actually engaged in public health administra tion but these restrictions may be relaxed

A Chemical Test of Ocean Currents -During a recent (apedition on behalf of the (arnegie Institution Dr A & Mayor noted that in the tropped Pacific whenever the ship met with a decided countercurrent running in an easterly direction against the prevailing westerly drift the water became relatively and 1 ha easterly current is often an ountered in the region of such law-lying coral mands as Palmyra and the Phoenix or Umon Groups, and is dangerous to vessels at night as there are no lighthouses, and the vessel may be driven on a reef before the presence of the current has been Whether the water is relatively and or alkaline can easily be determined by the use of some such in-dicator as thymolsulphonephtale in One has only to mux the water with a few drops of the dye and if the mixture is greenish-blue it is alkaline, while an approach toward activity produces a more nearly yellow color. This method may also be used to determine when a ship passes out of a current of tropical origin which being warm, is alkaline, into another current of colder water which, on account of its low temperature is less alkaline than the sea-water of the tropus

Bussian kanforations of the Siberian Coast -One of the most surprising pieces of news that has come lately from Russia is that, in spite of untoward political conditions an ambitious campaign of survey work in the Arctic Ocean along the Siberian coast was undertaken in the summer of 1918 under the direction of the Russian Hydrographic Office A programme of those under takings was published last November in the C s pies Rendue of the French Academy of Science by the vell-known oceanographer, General J G Shokalski who u still in Petrograd, so far as known Hubsequently General Shokalaki has found means of sending kitters on the same subject to some of his scientific friends in the United States The explorations were to be carried out by two parties One, working from the White See castward to Cape Chelyuskin was to be under the command of Captain Vilkitskii, the discovered of Nicholas II Land and the leader of the expedition which made the Northeast Passage from Bering Strait to the Atlantes Ocean in 1914-15 Another party surveying from Cape Chelyuskin to Bering Strait, was to be com manded by Capt P A Novopashennu Several new radio stations were to be established to facilitate the work of the expeditions

### Industrial Efficiency

Where the Building Problem is Being Solved One of the raties that has been foremost in beginning to solve after-the war ja d lems is Portland Ore which is cooperating in the building companyes of the United States Department of 1 of 1 According to pleas the city will construct not I so than 2 000 h uses this year Oregon is the source I in immens I unber supply un? there is an abundance I skilled I I i I r that ices n the outlook is reported t I mest n maging for build ing activities that will ils it it I st part of the surplus

New York a Housing Problem While the United States Department of I al ar has estimated that there costs in the country i shortage f '00 000 h uses as i result of the at ppage of building by wire uditions it is probable that half a mille a does not a wer the actual deficiency Reports from New York city show that living quarters there are now at a high premient have give up approximately one third in d rate priced apartments being subject to the largest incic ise ids of war wirkers have been trowded into the esta and the regular growth has been advanced in mini other ways America of Legatics shows an encouraging increase of building although it has not yet reached one third of the parmal volume of a matruction

The Coal Cover 1h small and unsuspecting rover has with not a doubt been the direct encire of a great many serious weidents that here dane their share in compiling the grand total of accidents that have curred on and about public buildings. A great many of the injuries caused by coal curves could have been me vented if a single ounce of precaution had been taken by the caretakers in charge of the buildings In vestigations prove that in a great many cases the direct cause of an injury caused by a coal cover has not been due to the neghpome of the owner par to the defective condition of the cover as a means had been provided for securing the cover to its movings and the casting was in the less of condition. The dire I cause is that the jameter or others has not securely fastened the chain when the cover has been just by k in place after it has been removed to allow end the placed in the cella.

Why Factory Smoking Should Be Stopped important hearing on fire prevention was recently held in New York city before the State Industrial Com mission. The danger of fire canned by smoking in factories wer ducused by several witnesses One authority make the suggestion that the regulations prohibiting smoking in factories be extended to 24 hours a day so that an employee could not smoke until he left the building I has authority also emplosared the danger of fire caused by employees lighting eigarettes and eigars as they were leaving the factory and car-kash throwing the lighted metch ande. Discon-tinuance of celluloid eye shacks was also advocated because they were so inflammable Several metances were cited where evenhades had enoght fire and the wearer had been severely hurned. It was pointed out that eye shades of this kind were not only a danger to the wearer but to his follow workmen as well

Scrapping the German Submarines Consider able importance is attached to the recent purchase of 25 German submarance by a British firm of 1 andon and Swanzea which will undertake to break up these vessels and dispose of the scrap metal. This firm is a large ship breaking company and during the war handled considerable quantities of wrap iron brought over from the battlehelds of Irance It recently purchased at auction 25 German submarines 12 of which it intends to bring to its works in Swanses. It is estimated that the breaking-up value of each vessel will be \$12 100 and for the dozen \$145 992 The work on each sulemarine will occupy 10 weeks and considerable additional labor will be employed by the company The scrap metal thus obtained will be sold to the various timplate and steel mills in the Swames district. This development of the ship-breaking industry in Swansca will be a very un portant one not only to the part and as a means of our ployment but because it will provide great quantities of high-class material for the timplate and steel industries The remaining 13 out of the 25 submarines purchased will be broken up by the same company in other ports of the United Kingdom

It took three years and about 38,000 to secure permission to excavate two missions of the security of

### Plants That Make Stones By S. Leonard Bastin

I T is well known that plants are continually taking up various mineral substances from the soil Most of this matter is spread about in various parts of the organism and is not very apparent to the casual observer.

Now and again, at certain points, there will appear an accumulation to such an extent that stones are produced. Thus, occasionally, inside the stems of the bamboo a hard rounded mass is found just at the joints of the cane nava roundest mass is found just at the joints of the cane. These are of a silicious nature, and probably represent an excess of silica taken up by the plant. Even more interesting are the coccanut stones which can at times be dug out of the endosperm of some kinds of cocoanut These are usually round but they are sometimes pear-In color they are white, and not unlike pearls, although not so lustrous. As a rule these stones are about the size of small cherries and they are quite as hard as felspar or opal On account of the ranty of these hard as felapar or opal. On account of the ranky of the in-coconaut stones they are very highly valued by the in-habitants of Java and other East Indian islands. It is generally considered that they act as charms against disease. These stones have been carefully examined and they are held to be composed of pure earbonate of

Somewhat similar processes are occasionally proin pomegranates Apatite has also been discovered in teak wood. The curious water plants called Stone-worts (Chara) gover themselves with calcarous deposits This is so much the case that as these plants die down anis is so much the case that as those plants die down each year, the bottom of the pond or lake is appreciably raised by the accumulation of lime which of course does not vanish with the decay of the stems

# Mobilizing a Lady Bug Army to Fight the Aphia By Horace E. Thomas

NOW that spring has come and the chill of winter no longer retards the growing grain a strange army is being marshaled forth into the cereal fields of the Pacific Its divisions, brigades and regiments are composed of lady bugs and they are sent out to attack

composed of lady ougs and they are sent out to a their natural prey, the aphin sent sent out to a Scientists have long recognized in the lady bug, lady bestie or lady bird as it is variously called, a beneficient agency in its disproportionate struggle to exterminate the aphis, or plant louse Herstofore the bugs have exercised complete freedom in their go-as-you-please efforts to hunt treeuon in their go-ma-you-piesse chorts to hunc down and devour the aphis. Now however the lady bug, which perhaps is least offensive of all the huge bug family, and for which nearly everyone has a sort of freedly feeling, has its campaign mapped out for it and will be sent where it may do the most

od by enjoying unlimited gastronomic activity
The lady bug hibernates in the winter — It is no The lady bug hibernates in the winter of a tropism that warms it with the approach of cold weather to seek shelter In colouies numbering a million or more bugs it bivouses in the mountains and foothills, There, protected by rocks and crovices, it lives safely There, protected by rocks and orrovices, it lives safely through the ood weather. What it is goused from its stuper by the spring sunchine it again makes its way to the lower levels when the tax of the strength of the the strength of the

The stonewort secrets so much lime that its autumnal decay raises the level of the water bottom

it is believed that the lady bug arm; will accomplish mo toward eradicating the aphis if left to its own devices Others consider the plan as promising permanent relici to the farmer, at least in some localities All authorities

agree that it is worth trying and are cooperating to make the test complete and decesive. That it is a matter of real importance as well as interesting as a novelty will be realized when it is considered that the annual plant destruction by aphids in the Pacific northwest alone entails a loss of from \$10,000,000 to \$20,000 000

Agents of the United States Forest Service have taken the lead in collecting the beetles. The forest ranger has exceptional opportunities to find their eaches exceptional opportunities to find their factors which he came upon a colony be rejected it to the country agricultural agents who were esperiting in the work. It was no trick at all to scoop the bugs interaction is to be their accountry to the control of the second of the control of the con which were to be their newhone. The receptualism partly filled with excelsion which served as a roost and the bugs were stored away to be kept through the winter. at as constant a temperature as possible in the neighbor-hood of 38 degrees above zero. In one instance an aban-doned brewery was their temporary home, another huge conce for were was their temporary nome, another buge colony occupied an apartiment in a meat packing plant, which was kept comfortably near the freezing point and where there was no fuel problem to worry them. On bright days they were taken out to sun for a few hours to check any fungus growth that might kill the beetles

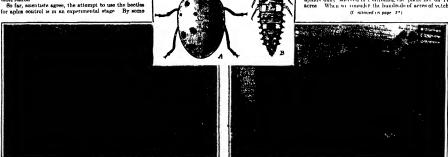

The Bureau of Futomology of the Department of Agriculture through its station at Forest Grove Ore, has cooperated in the enterprise to the extent of collecting data and giving advice. Results will be carefully tabulated and a complete survey prepared for publica-tion. The men in the entomological service have been careful not to give too great encouragement to the may be beneficial under certain conditions, they believe, but where the aphis is at its worst they have little hope that bettles can be assembled in sufficient quantities

This opinion is shared by Prof A ( Lovett, entomologist of Origon Agricultural College, who has made a thorough investigation of the lady but the as a inade a thorough inviceigation or the says be used as a natural for of the aphs. In normal years he says the aphsis pet is kept under control by the lady bug and other neemen a such as the syphis fiv the larve of the late wing fiv and the lampyral bettle all of which, including the larva of the lady bug devour aphids

m great numbers and a minute wasp that kills them by its sting. The common impression that them by its sting. The common impression of the weather kills plinds is a unistake, he adds, the fact is that warm days are favorable to the meants that destroy the aphid. When a to the meets that destroy the aphid. When a few warm spring days are follow. I by cool damp days the aphis thrives because its insect enemics are mactive under su h cachtions

When there is a 1 all outhr ak it aplas such as practically destroyed the yet hecrop of western Oregon in 1915, there is little hepe of relief from hady longs at ording to Profess r Lovett. The chimatic factor then presented an insurmountable harrier to the successful use of natural enemies. he says and continues

In an experiment curred on last year 210 pounds of In an experiment curred in list vier 210 pounds of aphids were celleted from a 12 vir thild of with. It was estimated that this constituted 60 per curred all was estimated that this constituted 60 per curred all mounts of the proposed of plant in the same of aphics were counted announting (+513 - 1 his would be then perporamently 254 6000 pilotia in a pinul in 88 900 000 on the 12-acer tract. Ingered on these bases 25 000 000 and by bags would if decouring, then maximum of 200 sphids daily succeed in controlling the plant lice on 77 acres. When we consider the landreds of acres of vetch

A indy-bug colony, at hame for the winter, from which two million bugs had hear removed before the picture was taken. At the right, eacks of the bugs prepared for "live storage" in a safe place; above, adult (A) and larra (B) of the aphia-cating lady bug

Scratched Joints Versus Smooth Joints in Gl

Scratched Joints Versus Smooth Joints in Qilpius THE common assertion that stratisfied myfaces are hard to prove Comparative tests made on several consances by the Forest Products Laboratory all indicate that the strengths of these two types of joints are practically the same. The test specimens used by the Laboratory were paire of hard maple blocks, some with smooth and some with tooth-planed contact surfaces. These blocks were glowd with a high grade hide gitus, allowed to stand for a week, and then statered apart in an Olsan universal testing massibne from joints of each type were compared in a magle test.

# Light and Progress

# The Part Played by Artificial Illuminants in the Development of the Human Race

By M. Luckiesh

"O first created beam and thou great Word,
'Let there be light and light was over all'
Why am I thus bereaved thy prime decree?"

THUS through "Samson Agonistes' comes the lament of Mitton, whose eye-aight has failed Perhaps only through a similar loss would we fully appreciate the transandous importance of light to us, but imagnation

tremendous importance of light to us, but imagination should be sufficiently capable, if duly accrued, to convince us that light is the most essential and pleasure giving phonomoun which makind experience. The importance of light is early recognized in mythology, being the solverment of the Creator immediately following the creation of "the boaven and the earth," and the word "light" is the 46th word in Genous, the First Book of Moses Light has played a conspicuous skie is the architecture of many nuclear-in role in the mythology and religion of many peoples—in many cases the leading role—Throughout all time both primitive and civilized races have had gods and goddesses of light Even today there are people who worship Light as the god of all — and in a sense they are not

The poetry of all ages abounds in the use of light and color for clothing the emotions, suggesting the possi-bility of a language of color, at present but vaguely appreciated The poet has availed himself of the powers appreciated The poet has availed minsen or the possess of light and color on the imagination in exciting, heighten apprenaised. The poet has availed inimet of the powers of light and color on the imagination in conting heightening, and extending ideas and sentiments, in the ron-struction of epithete, in the decoration of figure, satural relativistics, and in all the imagery and witchery of his article, and in all the imagery and witchery of his merely fanofully or conventionally, but even these uses merely fanofully or conventionally, but even these uses monoments they have sequent agmidistion smaller to words. Light and colors doubtless have their offsets upon the pisson, feelings and intellect even though their language is not at present plan to us. Is it not suppose the properties of the propertie Light has many synonyms, but one which we would apply as very befitting in Progress. The truth of this is readily shown by reviewing the history of light from the dawn of the race to the present time. If we go back in imagination to primitive man whose activities were bounded by sunrise and sunset we gain an idea, by contrast, of the complexity with which light is intercontrast, of the complexity with which light is inter-woven into our activities. In our retrospection, written hastory fails us long before we reach the primitive ages However, we can safely trust our imagination to penetrate the log of conturns of unwritten history and find primian huddled in his cave as daylight wanes pelled by the evolutionary spirit of progress primitive man desired to extend his activities beyond the boundaries of daylight and eventually learned to make fire This furnished him with heat and light which achieve ment elevated him from the brute kingdom and marked the beginning of the genus home

From the pine knot of primitive man to the wonderfully convenient light sources of today is a long interval consisting, as appears retrospectively of small and simple stop, long periods apart. Measured by our present standards, progress was slow in the early ages and we are inclined to impatience as we follow the history of we are inclined of impactance as we collow the instructory recent light and progress even in the comparatively recent centuries of written history. As is ever the case civilization must constantly readjust itself to the discoveries of science and the developments of invention. Only 100 years ago the proposal of lighting the streets at night met with loud protests based on various reasons, theo-logical, moral and economical but after adjustment to the new idea, civilisation is requally vociferous in com-plaining of the darkness of streets

The burning fagot rescued mankind from the shackles of darkness and the greage lame and tallow candle have done their part in paying the way for man's achieve-ments of today. Artificial light extended man's activi-ties and has been an important factor in mental development It perhaps has ever been true since the advent of artificial light that the intellect has been largely

nourshed after the completion of the day s work
Artificial light has been an important factor in the
great progress of the present electrical age. Man now
burrows in the earth, navigates under water, travels on

the surface of our sphere and sails among the clouds piloted by light of his own making. Progress does not halt at sunset, but continues 2 hours e.h day. Building printing, manufacturing committee and other activities are prosecuted continuously the working shifts changing every eight ten or twive hours regard. some changing every spart (in o twice it has regard less of the rising or setting sun. Artificial light affords man an opportunity for study or recretion after be has done in days work in company with the sun. The great achievements of the artist and artists narr not in obsourty affer suisact, but are to be soon by right as will

If some great genius could evaluate the possessions of mankind artificial light would appear conspicuously in his report and doubtless would rank very high in imporand value Among man-made things perhaps it would rank first in value. In the production of light, man s early efforts resulted in light of an orange red color. The meandescent lump industry began with the carbon filament lamp in which a han like filament emitted a deep yellow light. As the industry developed through the combined efforts of many individuals en gaged with various allied problems the temperatur of the filament has increased the light has become whiter and the efficiency has been multiplied many times Lach improvement has resulted in a slight step toward artificial daylight Foday the efficiency of the lamp is so much higher relatively than those efficiencies of older lamps to which the pocket book had become accustomed that it is practicable to convert the light into any quality or color which necessity or esthetic taste demands last steps in finally reaching the objectives have been sass ac, ps in many reaching the objectives have been made by temporary expedients—by the divelopment of colored filters which convert raw light into light of more desired qualities. These ends will principle reached some drey by more direct included. I victually seem tific discovery will perhaps give us a practicable lamp. which emits artificial daylight directly from the light source and others which meet various esthetic and

source and oracis which much various estimic and psychological requirements. Imagination is indeed dead if it is not awakened by a retrospective view of the development and impor-tance of artificial light, and of its contribution to the progress of mankind

conditions, but it will furman nutritious pasturage, rich hay and valuable sitage. Sweet clover is also of the utmost value as a source of nectar for bees

EVERARD B MARSHALL

New York, May 2, 1919

# Farming for Returned Soldiers

To the Editor of the SCIENTIFIC AMERICAN Your Secretary Lane makes it clear in his article in your issue of November 9th, that there are farms enough to go around among the returned soldiers, so far as the to go around among the returned soldiers, so far as the mere matter of land is concerned., but he does not enter not any explanation of how the soldiers are to be asked to farm them. The great and important question of soldier settlement is right up to us today, demanding our best thought and attention. Yet so far as I have been able to note at is being approached, on both adder of the world's most peaceful frontier, in but a half hearted way, and from the wrong viewpoint entirely. I have recently written to the Officaus Journal upon this sobjects, and our belong the liberty of putting the views and can belong the liberty of putting the views. So far as I have observed, all the schumes proposed for the settlement of returned soldiers, including egetantly the one finding efficial acceptance in Canada and presumably the one Secretary I ame has it mund, are

presumably the one Severetary I ame has in mind, are amply modifications of the old system of farming—or at best attempts to graft innovations thereon Yet this system is by far the most expensive and extravagant

this system as by far the most expensive and extravagant ones that could possibly be adopted. I can conceive of no plan that would be more wasteful of time, labor, building, and the equipment accessary to carry on the busness of farmang, and pet the effort is being made to induce the returned men to accept these methods. As a rule, at the present time each farmer has he own set of buildings, standinery, horses, exitie, and the necessary purpolarisist or as much thereof as he can afford, and about he be fortunate accept to have selficient halp in the family he worms along. I return to any that on every those average uncoostill farms of the synthesis.

100 acres each there would be found sufficient machinery and other necessary equipment for the successful work-ing of 1 000 acres—with the possible addition of one team of horses or one tractor

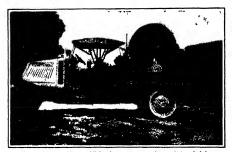

The tune the farmer wastes in marketing his products. and the methods employed are worthy the most serious consideration. In this same period with more efficient methods, he could quite as well market ten times the quantity

The same arguments regarding waste of time hold good the same arguments rearring waste or time note on with respect to the work around the buildings—chores such as milking feeding, deaung of stables and general care. These in ist be attended to daily and at present the farmer is tied hand and foot to his farm and forced. to neglect other matters of importance to his frequent to argues other matters of min) retailer to ma frequent financial loss. No wonder the young people fee to the city with such unanumity! And this or a modification thereof, is the scheme that we are apparently going to ask our returned licious to take on in order that they

may carn their own living and help to bear our burdens.
This prospective advent into the farming game of a great quantity of new farmers, who will farm new lands should be seized not as a mero incident in the extension and perpetuation of the old old system, but rather as golden opportunity to install a new one All the great industrial and national undertakings succeed in direct ratio to the measure of intelligent cooperation with which they are prosecuted It is suggested that a great effort should be made to utilize the creation of farming communities of returned soldiers for the introduction into agriculture of these same benefits. The details of a comprehensive scheme of cooperative farming and cooperative marketing are far too numerous and in-tricate to be worked out in a letter to the Editor, but without doubt the men who had the sand to drive out the unspeakable German would be well able, with necessary and competent supervision, to arrange such details to their own satisfaction, benefit and advancement and, let us point out, at the same time to the benefit of all the rest of us

A. H. HAWKINS

A parabolic mirror for sound, which enables a hostile plane to be located on the darkest night, and at surprising distances

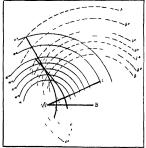

# Listening for the Enemy

# Sound-Ranging Devices Employed to Locate Hostile Guns, Planes and Submarines

I may be taken as a maxim of modern warfare that wherever the enemy is and whatever he is doing he will make a noise in doing it. If he is kning a hig gain at us from fairly near he will he he both only a well he ar him on a dark night with a eage of bomble we will he ar him in a comparatively solint activity like submanning we may need to use arither to bring him above the tirch he de audibility. But in any event whatever the circum stances rest assured that we can har him.

In the effort to take advantage of the situation both parties to the lace conflict exerted thus ingenity early and late to divide apparative and to improve methods of soun Iranging on 1 and and in thin in and at set. The first place where the act of locating the to by listen ing to him was brought to a first state of periction was in searching for distant and coneral distants. Without developing has eleborate apparatus, a little ingenity in the practical application of a very simple making material principle involved is more or it is general to encaded gans with a very decent degree of accuracy. Since the principle involved is more or it is general to all sound ranging it may be worth while to look into it with some fullness.

Suppose we has two observes stationed at A and at B 4000 fact Apart and council by trielphone fee them by provided with apparatus of an b dosign that when a gun in finch this can space-train the previous of time that elapses between the recupt of the sound at their respective rations. Suppose that it were thus catabilisted that observer A hears the report two seconds before observes 18 succession waves travil some 1,150 feet per second this means that the gun is 2 300 feet mearer to A than to B.

How a gun is located by timing its report as heard at three points

If the mathematician were now called in, he would point out that the conditions 1: imme a hyperbola and that the gun is loated a in whi con this curve For the hyperbola is defined as the locus of points whose distances from two fixed points differ by a fixed amount Moreover, if we are given these fixed points and this fixed difference, the hyperbola is completely determined, and can be drawn. The mathematician would priefer to say that its equation is determined, but the artillerist goes might ahead and draws the curve, without bothering his head over the equation

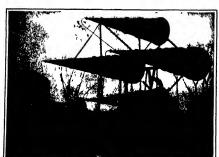

With A as center he draws a series of circles at, at, at, etc. with any convenient radii—say 1,000, 1,250, 1,500,

feet in the about B in draws another set of circumstance in the about B in draws another set of circumstance in the about B in draws another set of circumstance in the about B in the second set in a point that in corresponding circle of the second set in a point that is corresponding circle of the second set in a point that is corresponding circle of the second set in a point that is corresponding circle of the second set in a point that is corresponding circle of the second set in a point that is correctly and the second set in a point that is considered in the second set in a point that is considered in the second set in a point that is considered in the second set in a point that is considered in the second set in the second set in a point that is considered in the second 
Using the same method to determine the time-differtive between the receipt of the sound at A and at a third at time (a third set of circles can be drawn about C, with appropriate radii. If the report reaches C one second after it reaches A for instance the circles c, o, o, o,

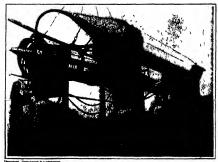

will have radu 1160 first greater the erretes 9, 5 c will have radu 1160 first greater than the corresponding radu of the earlies about A. The intersections of the errices about A with those about C give us a second hyperbola upon which also the gun lies. But every light-school student knows that if it lies upon both hyperbolas it lies at their intersection, so that when both

curves have been drawn, its position is fixed.

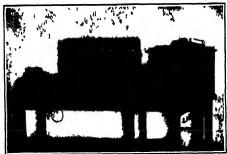

It is procedure will be as satisfactory to the mathematician as it is to the stillerist. In fact, it is the line of attack which the mathematician would doubtless.

Long-horn set used by the French in locating enemy aircraft

A British hydrophone operating on the principle of angular divergence

The phenotelemeter, for precise and immediate location, electrically, of hestile artillery by means of the sound emitted

employ if some heartless wretch were to suggest that up the sound waves that use from the projective after setting the equations of his two hyperboluse he of a hostile submarane and trust through the water setting proceeded to construct the curves. It is sufficiently the water these audible to the human car in addition to the curve.

control this feature by making the circle as close as need by Accordingly as accurate for all nurposesas come as need in Accordingly as acon as the graphical work on the problem has been completed, and the location of the hostile gun put into the language of the day for the benefit of the friendly gun we the latter can proceed to drop their welcome billets-doux upon the critical

It will be observed that in theory the method is the amplicat, but naturally there areas various difficulties in practical work. Apparatus must be in skrong make-up, but sufficiently sensitive its source societies timing. The a given sound must be distinguished with constitution of many others and the report or dictionation must be kept distinct from the sound of the shift light Allowance has also to be made for the orientation of the orientation orientation orientation orientation orientation orientation orientation ori It will be observed that in theory the practice at a comparatively (art) date— the more so because of the possibility of averaging a number of trails for the time-difference, and again averaging.

averaging a number of trials for the time-difference, and again averaging a number of indicated positions as obtained from a various combinations of last nump positions. It is method was found especially useful for locating batteries that had been sooneedlattines than the desire of casonations, or he hree at exactly the same instant a manber of guns at various range While it is possible partly to meet these and other hindrance it is not exceed to do so, and it is not possible to checkmate them altogather. On the whole the margin of error which they introduce into the work is an uncomfortable one, and the shorten detector was born in the effort to reduce it.

the electric detector was born in the enert to require it in turning to this, the sound-rangers were hardly treating united ground Always there had been cr-counstances under which the distance of a houtle outli-might be too great to permit satisfactory returns by the anded ear, or the enemy may be operating in some-ng, like an airplane or a submarine, that merely makes noise as distinguished from a report. Then it is noise as distinguished from a report. mary to have apparatus for recoving the sound, and ape for magnifying it as well. And it is immedi-found that when any extended mechanical equip-

ledy found that when any extended machinated sequip-ment is necessary for its recognice, the matter can be implified by mecoporating an device that will at least death and the second of the second control of the second control of the second control of the distance. One great he this skyle of automate count-reception me that of anti-arrents work. We illustrate a set of corns designed for the purpose by the French, and this-ries whelly usages apparetus get up by the American antipart of the second control of the second of the second control of the second control of the second of nonesthing to be desired in the line of accuracy. The tendent of upthe will tell us catagorically that the nacionarus officiency is to be got out of a parabolic undactor, not be accurate componer was following a pretty infinitely masted path-wellfield that the sound detector

in that form The particu-lar parabolic sound marror which we show will jack up the learn of a hostile an place at a distance coust to three and one-half times the greatest range of the human car it is catremely light and portable to the last degree Then to comh ppens to mumay plenes show the pertable search light which travels with the some ranging cuttits for the perpose of illuminating the period of the night and making it possible for Archir to take a shot at

The recording tape, galvanemeter and tuning-fork timing apparatus in the absocialemeter

in one way or another, as already described in these columns it indicates the distance, or the direction or both of the source Caven such afficient aids to location of the enemy or

these it was but a step further to the utilisation of the valuable sound-detection powers of electricity One of the most effective instru-ments of the enters sound ranging tampaign was the phonotelemeter, another American development In this apparatus the dual rereption principle is again employed only here the two points of impact for the sound are so close together that without the electrical that without the electrical features of the device, no distinction could be made between the moments at which the nound reaches them. But the assembly uncludes a tunng fork which is kept in motion electrically, and its successive shrokes and its successive sproket divide a second so accurately into so many parts that it is a ample matter indeed to so oure a graphe record that ourse a graphic record that combines the strokes of the fork and the impact of the sound upon the two dis-phragms, and accordingly shown just how many thoubetween the two impacts. Thus, in combination with the well known terminds that the sound is louded stime increphone when it fills perpendicularly up a the shaphragm makes it is matter of comparative as to get up an instrument while will rever it in in minimal the up an insertiment with the west of the final matter the premise distinct and direction of any source of almospheric disturbances. plane that is really jet tirel

Plane that is ready jet that No doubt their will seem be nicplanes on the market for as low as \$400 Lit unless some distinctly new prin-ciple of constriction is called into practice, such machiness cycle of constrict a in seamed into practice, who maximizes will hardly he safe to fly. To be really practical an ampliane must have a sufficiently powerful motor to buck strong which and must be see exerticated that the motor is ahead if the pilot. There should also in provided a stanneh lunding gear in order to take up all shocks

The accompanying the tration serves to show a form of incopensor machine which is decidedly daugerous in fact, there is nothing distinctly new about it for the mak, sitter is nothing institution we actual in a fun-reason that a very similar constitution was followed in Banton Dimmin a Demoiselle moneyplane which was flown to some extent in 1909 and 1910. In the present machine which has been designed to provide an in-expensive, arphane for the general public at well be noted that the V vilinder rigins as placed above and somewhat that in vivinder ingul is place above an each was a shead of the plot who ists in a small nacell below the wings. In landing gear consests of an aid and a pair of whitels directly fast ind to the front of the nacelle In the event of a hard landing they is absolutely nothing In the event of a first insteading there is amounterly nothing in the machine to take up the shock such as resulted. V structs as in most machine and there is nothing to prevent the taginer from reading due to he paled. The only feature in favor of this machine is its low price which is not machine and the regular machines machines of the regular.

biplane tractor design
by it fillows that an acplane can only be sold at a liw price if the fundam rital principle of safety are set and find ed it as very much found that as the public turns more and more to very day fring there will be multicous fatalities due to the me of machines that are poorly deagned and cheaply constructed.

### A "Super-Charged" Amplane Engine By Benjamia 5 Foss

UNDER the stimulus of war the net of the arriance has been marvelenusly ratended not only horsauchally but also vertrailly 1 light situte it symp has become the rule rather than the exception and we a consequence the disficulties which confront the variance in these altitudes have become actual. These deficulties in turn have been passed tout to the across matched enquence and a renow study, has anothed enquence and a renow study, has

been made with the view of solving these highly technical problems

As is well known the hunting factor to

As is well known the intering lactor so high alittude flying as the ramford at-mosphere which adversely affects the engine quite as much as the pillet. The density of the atmosphere decreases density of the atmosphere decreases progressively as one according and causes the engine to lose preser until at approximately 20 000 feet, the nagina developes but 50 per cent of its hurse-power at sea leavil. Moreover to comprenate for the lack of support offered by the ranfield have to support offered by the ranfield speed cannot be obtained on account of the lowered power of the capine. These factors determine the maximum aftitude known as in, "ceiling," of the airplane, above which an airplane of given power and load cannot rose.

load cannot rise Could the power of the engine be main-tained at these high altitudes not only would the calling of the surplane be greatly extended, but greatly in reased speed would result on account of the decreased resistance which the tim atmosphere offers age of the airplane

This single-seater monoplane is one of the latest attempts to build commercial sirplanes at a very low cost

This problem of maintaining the power of the segine at high altitudes is one that he absorbed the energies of engineers for several years, at I various methods have been employed partially to various this difficulty These have included the adm-sen of oxygen to the

This blower, attached to an airplane engine, permits of efficient operation at high altitudes

engine, compensators for the uburctor auxiliary air intakes, high compression pist ins it? At best, it may be said that these devices hav only partially solved the difficulty, and are temporary cay dust by inding the di wiopment of an engine which will maintain a con-

stant poweroutput, irrespective of altitude.
For a long time it has been recognized that, if the air density as the instance of the engine were held constant, the horse-power of the engine would be maintained. The physical processing of the engine would be maintained. physical properties of the atmo main the same at all altitudes merely a question of increasing t physi to approximately sea-level or maintain the sea-level power of

maintain the ess-sever power or to a sequent The is a question of forced draft. The difficulty of applying forced draft, at were, to the eagen has been to develop a device sufficiently large to furnish the volume of an recessary, espable of protein-ce and the required air pressure, and at the same time, light enough to be used on a arplane. Moreover, the means of operat-ne this develop has been a controlling faster. arritane Moreover, the means of one ing this device has been a controlling insemuch as variable speed is dears vary the air pressure and volume act to changes in altitudes and atmos

The mechanical requirements of this problem demands a high speed retary blower, driven by the aughent sequence and discharging its air mit the initial of the method triude, the appeal of the appeal

At the recent Acro Exposition in Madison Square agroument American manufacture exhibited a rotary blower, mounted on a well-known type of six-place sagne. This blower is the result of two years' development and test on the part of the company's engineers, and none for the first time was publishly rhown like device which is called a super-charge fan, consists of a lagh reged mixery blower mounted on the segments of a lagh reged mixery blower mounted on the segments of a far wheel, cut out of a soft bullet of set cit and endowed an a preal summum bousing. The fan is mounted on ball bearings and driven brungs a chain of grear with final best connection to the through a them of gears with final belt connection to the through a (ham of grear with man best connected to de-cagine II to operates at 10 times engine speed, ap-proximately 15 000 revolutions per minute I is stated that the fan will diver a pressure as high as 14 pounds per square useh which p-riformatio is certainly unusual in a minde stage fan of this description

The blower is entirely automatic in operation and it controlled by a barometric divice connected with the variable speed drive whi roby the air pressure is increase. (Continued on page 524)

# Pulling the Trigger by Pluid Pressure

THE (rerman has been shown up by the late war as an implantor rather than an inventor. His forte lies in A inniator rather than an investor. His forth his chang an idea from some foreign source and squeez the puce out of it until it goves up an amount of practicity which the conceiver would never have supposed he in it. And by the same token, when anyone deep committed on the contract of 
and a host of other Britah and Freuch and American inventions, but there was one intie invention, which first new the light during the way, and which Fristes newer was able to use—apparently for no other reason than the very good one that he couldn't figure out how it worked. The was a devose, weighing but a few promeds, known to the instituted as the "C. D. Clear". It was thin pare which gave to the Alihea spootly portion of these meaning and property of the country of the country of the spacety does. This devices it for from being a cens-

It e

# Selling Woodworking Machinery Abroad

"THLRE has been a lot of talk about the vast number of temporary dwellings required to shelter the home-less people of devastated northern France and Belgum," remarked a machinery manufacturer "It has been asid less people of devastated porthern France and Beignum, rumaried a machinery manufacturer "It has been and that a great deal of woodworking equipment will be needed to turn out the such, doors, shinds, flooring and other parts of these houses A representative whom we ent to Europe informed us that the British and the hreach makers of this sort of machinery will probably obtain most of the business. American woodworking apparatus has been criticated in England because of his lightness, machinery obtainable for American wood not always being suitable for British wood, such as eak, elsa, and planing machines are bung und by Records wood-working firms. American small tools of many hinds, medicing chicks, gouses, saws and planes, are resultd in every important shop.

## A Bridge Without a Trace of Metal

THE natives of Java have a bridge-building technique which utilizes to the insit their slight resources for work of this character. Of raw materials they are acquainted with but two, and one of these is really a product of their own ingunity. They have no nails, no iron, no true wood, they are forced to rely entirely upon bean-boo for the structural parts, and upon a rope of their own manufacture to effect the junctures. In spite of these limitations, they achieve highly oreditable results, as the photograph reproduced

berswith will go to show
This picture represents a bridge over a river in the central part of the island. The mean is almost 150 feet, and the width of the readway some four feet. The four of the readway some four feet. The fear bamboo columns at either side of the stream are built up of a double length of from 50 to 60 hamboos, tied up with rope and firmly presend together by forcing a quantity of wedges between rope and bamboos. Such columns are found to be of romer/shable strength and elasticity, trength and charactery, in fact, used throughout the Dutch Indies as derricks for lifting roof-pans when building sugar factories, etc. The original element which the Javan matives have brought to the construction of

matters have brought to the essecution on these budges, as reinarked, as the rope That is made of a flort takes seem the nature arca-palm, which grows all over the masset. This floor, as shown by a sample placed in our hands by Mr. T. Karthaus of Egenar, fave, as of a black and herry substance & sequint, users, so to back and notify successful was maken arope that results afterirely the heavy decaying action of the hot and damp treptical elimite with its legions of fungi, in fact, it haste for many years without any indications of rotting. So between this rup, and the bamboo, the natives are able to achieve a semi-permanent structure for whach at would be hard to find perminent students to what would be made that the same as peer on the ground of discipences and durality. Ferhaps the most surprising feature of the whole thing is the degree to which has been appreximated the best type of bridge are. How done as agreement savage knew that a bridge ought not be best performed finite. type of bridge arch

# Beauty and Utility Combined

Beauty and Udiky Combined
I does not often occur that beauty and utility can be
obtained advantageously. But in Golden Gate Park,
San Francisco, Cal, there have been coveded two outsides
advantageously. But in Golden Gate Park,
San Francisco, Cal, there have been coveded two outsides
and the control of the Combined Combined Combined

success of the experiment an Colden Gate Park makes it tured in Europe from Brazilian woods appear that the idea may well be copied elsewhere

Windmill of pleasing outline in a San Francisco Park

# Furniture for the Tropics

FURNITURL as well as other wood F pr ducts used in the tropics is subjected to the attack of insects known as termites This att ck is excessive in South America in the coastal regions north of Rio de Janeiro and is so certain and so severi that in the pin it of the Lorest Products exporting we denfured in to those regions unless the word use I is naturally resistant to termites or is treated with a poison to prevent the attack of these insects

There are a number of species growing in Brazil and other tropical regions which are naturally minimum to termite attack are naturally infinite to termite attack and which are used in those countries almost exclusively for the manufacture of furniture. Nome of the cabinet woods which grow in this country, however, possess such immunity

possess such immunity
Of course in order to compete with the
furniture now used in these regions the
linted States product must be equally
durable. One way of making it so would be to import cabinet word from the region in question make it up into farniture here, in question make it up into infinite leave, and return it. A sumil repractice appears to have been very successful among Luropean furniture manufacturers before the war when much of the furniture sold in Brazil is said to have been manufac-

tured in Europe from Brazilian woods
Another possibility that may be considered is the use
of some of the cheaper domestic furniture woods for
backs and cores after thorough impregnation with a poison such as mercuric chloride and the use of Brazilian termite-proof woods in the form of veneer for facing.

# Totaling Victory Loan Subscriptions on a Monster Adding Machine

PERHAPS the most novel of the many ingenious DFIHAPs the most novel of the many ingenious mechanical and picturial devices used throughout the country to stimulate interest in the various Liberty Loan campungan was the giant adding machine on which Defroit kept a record of the Victory issue subscriptions. This machine was set up on the front laws of the city

half facing the busicst section of Detroit. It was 22 feet wide, 31 feet long and 12 feet high and reached a total height of 22 feet at the back due to a raised base which

tilted the big machine forward.

The keys of the monster calculator were about a foot diameter and had the appearance of lunch counter ools A hidger page 20 feet wide and seven feet high was shown in the carriage—and the entires on this sheet were changed every day during the weeks of the loan. total substriptions also were shown in glass panels at the front of the machine, representing the dials of the ordinary adding machine

Detroit went over the top the first day with total pledges of \$63 159 150 and before the ampaign was over pledges of \$63 159 150 and before the ampaign was over the adding capacity of the giant 0 column machine was taxed almost to the limit—I lood lights illuminated it at night and hilped to make it a most successful means of sustaining interest in the loan

Giant adding machine on which Detroit's Victory Lean subscriptions were totaled. Size of machine 22 feet wide, 34 feet long, and 12 feet high

described their work and their plans for metallurgy, mechanical angineering, a the future to conference arranged by the tried segmenting and prime movers. Commit and intensive work began at problems were deviewed and numerous four points. Eventually the personnel inst would include morease of power needed several handred men and wonders the devices developed give procuses of the devices developed give procuses of becoming invaluable in navigation, on such as self-half in furnace and optiming and saining in fog, a curinit distribution of approach. A control of the beautiful of the control of the c

The Division of Physics, Mathematics The Division of Physics, Mathematics Astronomy and Geophysics dealt with 70 major problems. It altermined for example the pressures and velocities internal and external due to the dash brigge of large guns. Accurate date were obtained regarding the pressure, waves about guns of infferent caliber and curves plotted with the pressure with the control of the pressure with the pressure wi indica ing the sones in which our own no would be comparatively safe from shell shock. These pressures ran up to nearly 400 pounds per square mek at certain noints and the value of the plottings is

Amustante was also givin on range Assumance was also given on range inding problems which grow in complexity as the range of modern artiflery cimitantly moreases. Targets are often beyond the horison today where in the Spanish War the scales on range-haders ran up to litth more than 6,000 yards Decided improvi-ments were made in optical range-finders and other methods of range-finding while the sound-ranging service by which the enemy's guns could be so accurately located was initiated by the Council and

located was initiated by the Council and widely used by the Engineer Corps The Chemistry and Chemical Icch nology Dynamon had 40 problems assigned to it. The Division acted as a sort of clearing house and strove to bring together the problem, the best man for its solution and the laboratory affurding the best of these problems could be handled in our or more of the industrial and academic laboratories already established while others required such resources as only the govern ment could command and a Chemical warfar. Service organization New ap-paratus had to be invented to meet special needs unusual organic chemicals had to be meder and specialities such as anti-dimming its duties under six main headings. Since made and speciation size as and direction materials for glass were demanded. I have division afforded advice and was instru-mental in bringing the best the country. had to hear in all such matters for example it may be recalled that early in the war serious trouble was experienced the war a restar touble was experiented with primers. No through a ring study of primers had oven but made along physical-oh mixed lines on unvestigations were started, the purpose bring to work out tests and specifications so thante that maximum a flict new could be assured. This was a stomplished and proved of utmost vulue flightly, the time between the pulling of the floated by the between the pulling of the floated of the country of the pulling of the floated is one tan-thousandth of a second. Then there were such outstances as clear.

Then there were such questions as clear coal for gas masks, detection of small percentages of poson gases, the toucology of gases, fuels for motors and difficult problems in coramos and refractories l mation of atmosphera mirogen called for a special committee which conducted ex tensive investigations into all phases of the pitrate gituation and was of material the intrate situation and was of material and to the government in connection with the great Alabams plants of which mark will be said at another time. The explosive committee made a certain remarkable long distance star shell a success through the perfection of a proper ignition system, while new syntheses in the manufacture of new drugs reduced the cost 70 per cent.

ont
In a war of engineering that division of
the Council was, of course, deeply engaged
It had 14 committees at work and maintained closest cooperation with the great used closest cooperation with the great to said in the solution of unear process or generating concerns representing mining, generating receives representing mining, such as the second of the conference as of the generating as and ovid conference as deshiral information at bosses and all as the Engineering Foundation. Its abroad, in cooperation with governmental or through we did the second of the second

problems were diverse and numerous A list would include increase of power of sero engines at high altitudes when cargingtons aero enganes at nigh sistuaces when oxygen becomes more and more rare carburetons the measurements of high temperatures such as steel baths in furnaces and optical glass in posts electric welding of ships parts new types of guns and of helmets, the

The work of the Division of Agriculture and iclated sentines was principally that if and triated attracts was principally that in increased production conservation and sobjectation. The charman spin half has turn with the food administrator. Activities extended all the way from tribuser and such feeding studies for in-erasing our preduction of foods to the victimization of ro kines as one way to

extermination of ro into as one way to keep farm produits after harvest Never before has gology and geography played as important a purt in war, even though mush of the work was electional Manuals were prepared on depography net teorology, multiary geology as of the Luther a special produits of con-tinuiting materials are presented as the tention of clusters are considered as the content of clusters, nodes could have been system of military roads could have been built from Maint to Hords. This in formation was used later in relation to the loubling of concrete ships

And so the record continues through important work on the part of medicine and related sen ness where the cooperation and a lated sen noss where the cohparation of 12 national societies was secured psychology which developed tests whereby 1 600,000 of our troops were rated in an effort properly to distribute our brain power and human material work for the televal I radi Commission and assistance in the locationage problem in connection with enomy patents and the Patent Committee which is continuing its effort to suggest improvements in our patent system.

In two years the unfulness of the Council created as a war service body had been so conclusively demonstrated that on May 11th 1918, the President mented an mentive order requesting the Nation Academy of Sciences to perpetuate the National Research Council and outlined both by those whose cooperation it seeks and those who will materially benefit from and these with with materially included the this cooperative work we quote the follow ing managraphs from the order dealing with thi work to but arraid on

(Consistent from page 500) country. That is the reason why the great modern numerous of America positions and amount of the first and those few have been smagged through the Turkish custom house. That too is why in our numerous most of the objects are but reproductions of the originals found long ago. That also explains why in this country where is little popular interest in things amongs, and why it is generally believed that all things worth discovering laws already been discovering.

The Pioneer of the Trans-Athantic productions of the originals found in the control of the contr Some of the impulsion of the impulsion are carrely perceptible above the layer the pinin, others size to the height of I favt. The oldest of them cover the cit of the functions and Ballylonians. Oth come from the Fernkan, Parkhins or or Arabic times. In them are buried tenants

Countless boilers and dynamos generate it. Engines and motors

put it in motion. Miles of belting-much of it rubber-are the untiring muscles with which it performs the labors of modern man.

Without rubber belting some industries would still be struggling awkwardly along. With it many wonders are being performed.

You will find rubber belting where great flexibility is desired; where moisture, gases and extreme temperatures prevail; where loads are intermittent and strains severe; where strength and endurance are essential. Properly applied no other belting can meet adverse conditions so well as rubber. None has equal adaptability.

There's a rubber belt for practically every transmission, conveying and elevating need. And each is made by the United States Rubber Company, the pioneer rubber belt maker and the largest manufacturer of rubber in the world.

Their broad experience is at your command. You obtain its benefits when you consult our belting engineers. There's one in your town or nearby. A'phone call or card will bring him at once.

**United States Rubber Company** 

To provide the A. E. F. with the immense quantities of food, clothing and munitions which were absolutely required, an uninterrupted stream of supplies, 2,000 miles long, had to flow to Europe as steadily as any river.

In order that the fewest possible slips might be employed in this highly essential work, it was necessary to load and unload them at top spead. This was accomplished with wire rope operating on the most modern freight handling machinery. Swiftly as leastly these slender tensels of steel reached leastly these slender tensels of steel reached down from overhead erane or derrick Then up would go the precious burden to be deposited surely and safely exactly

Much of this wire rope was of Broderick & Bascom manufacture end in speeding the loading and infloading of vessels it was only performing as it has been performing in mine, forest and factory since 1875

there is a grade of B & B Wire Rope ex actly surfect to the work you have in head The strength of our Yellow Strand is not exceeded by any other rops of the sam-diameter and equal flexibility

Mesopotamia

(Continued fr m page 520)

so me ay and so great that the museums of the while world could not contain them all I ver in the level plain ancient objects I am I whenever the natives dig for water er plow the land and where none would think of seeking. A ligns River boats in reached out his our to push his but in marked out his our to push his but in mth. short toward which the curret was carriing him. Sudden's li-sum extrain of gold flow down to the water edge. He bud his an earliera pol m whi i someone at thousand or more years goe had burnet his wealth. De Suit the Iran it Consultar Agent at Buse h went showing along the shore of me year and On the summer of a an ent curd On the summit of a low mpr meang mound Tello he saw a large stime statue of an ancient Babylonin ing Later beneath the surface he i u l a dezen other similar statues, while ire now in the Louvre lor this discovery he was raised from the rank of consil ragent to that of an ambassador and a granted a arge fortune by the Ires h government. Near th. Arab en-Irs is government. Near th. Arab co-compount of this is a small mound called Drk1 in that I visited at and decided. Drk1 in that I visited at and decided that it ould be no fluing but the run of a mul i it guarding the canal. A little later the visit as verial binaryled, thousand, ma-mous is verial binaryled, thousand, ma-mous is verial binaryled, thousand, ma-mous in verial binaryled, the sum of about 1250 lt. C. has set be source of noars of the small clay tablets in the missings broadening America. At the museums throughout America. At the outbreck of the war some Arabs south of Babylon were digging for bricks in a mound so am II and low that the explorer thought it unw rthy of notice. In it they discovered mor than 20 large clay extinders, cash in seri! I with about 140 lines of fine writing ly if great Nebuchadacter. There he tells I who built the walls of Babylon which we one of the seven wonders of the world and how he restored the old temple which is sometimes called the Biblical
I wer of Babil Once while walking
over a low mound near Kut-(1 Amara on the ligits I found ancient Harthun copper come so thickly senttened on the surface them they were corroded and less but they indicated what may which is not they indicated what may some day he found down in the protecting clay of that mound. The work of the archi dogist in Mesoputamia has hardly begun and centuries will pass before it can be completed

At last the furkish I maire is breaking

up At least Mesopotamia has been wrested from the obstructive Turks and this wonderful ari hacological field promises to be obsured to the explorer. When the took control of Fgypt a new impetus was given to the study of the ancient civilization along the Nile Instead of obstructing the work of the excavator, they encouraged him in every possible way Scholars were invited to I gypt and any-one with the necessary qualifications and incare has been permitted to dig wherever he s uld In Caro was constructed a ne ii iiii in Carro was constructed a great uniseum when the scholars from all the wild may study every detail of ancient Egy jiam ble. The I gyptian government has iccu exceedingly liberal with the ex-caval r permitting him to take from the country all duplicate objects or whatever was 1 st desired for the Cairo museum Thus I gyptian antiquities now form a part of the collection of every museum, and the interest in things Egyptian has become

widespread What has taken place in Egypt will also take place in Babylonia. Already steps have been taken to promote the explorations of the ruins An American school of archaeology has been projected for Bagdad beveral expeditions are in formation to go swith expections are in formation to go to the most promising of the buried rities. Probably in Bagdad will be erected a great museum where the most valuable of the treasures will be stored and made accessible The Healt digiting by the Arabs will cease. for the traffic is an-

The Future of the Archaeologist in tiquities and the smuggling of them from the country will no longer be possible. The excavator will be allowed a part of his discoveries for his home museu From the Babylonian and Assyrian r o far discovered we have but faint glimp

so far discovered we have out in....
of what may yet be found
Another obstacle in the way of Babylonian exploration work has been the difficulty in reaching the country. No in-liabited part of the world has been more macressible. The long journey overland from Damascus to Bagdad required nearly a month of the hardest desert travel The longer way by water from Bombay up the Persian Gulf and the figns was so very expensive in both time and money that the tourist never ventured that way Now Bagdad is all but connected with the Mediterranean by rail, and the journey once requiring a month may be made in less than 18 hours

Still another obstacle has been hostility of the native desert tribes. All that will soon pass. The explorer who nostility of the native itesert tribes. All that will soon pass. The explorer who ventured into the interior, even when guarded by Turkish soldiers, took his life in his hands. Sometimes he had to fight his way or buy his safety with gifts expeditum to Nippur was broken up by the shooting of an Arab horse thief The the shooting of an Arab horse thef The German work at lears was closed when an Arab workman was killed Nearly every expeditum lase cost human life Now a railroad has been built along the Tagris, other lines will reach into the meeric like the second of the result of the second of ragatel and converted to farms The face of the Furopean, which many a Meso-potamian Arab had never seen before the war will be familiar. The native district will disappear and the desert will be safe

The methods of excavation will probably change as l'uropean influence spreads over the valley In the past the work has been carried on in a most primitive manner. The men have been ignorant of any kind of labor Then tools were crude and of local make The American pick is too licavy for the Arab to handle The shovel is a mysterious and complicated matrument and nothing is more amusing than to watch an Arab in his vain efforts to gui ic a wheilbarrow. The men work in gangs of ninc. The head of thi gang is armed with a small line armed pick, almost a toy with which he loosens the dirt With him two men with short-handled baskets, and the other six men with the baskets, and the other six men with the baskets of dirt on their hips, slowly dance and sing their way to the dump. The and sing their way to the dump 1 in future exeavator will adopt more modern methods. The Arabs will be trained for their work. They will use modern im-plements, and the dirt will be taken to the dump by rail

A generation ago the study of archaeology was bardly regarded seriously delve among the ruins of the past sec to most people a useless thing to do to most people a useless thing to do The archaeologist was a fossil as old and as dry as the things he would discover The archaeologist of today is a scientist trained for years by the study of language, history and art He is a practical man for history and art He is a practical man lands and deal with aswage tribes He is no longer the fossil he may once have been He must have the gift to touch the things long dead, and to make live again the long forgotten civilisations of the remote past Mesopotamia once more may be developed to feed all the world with grain No less valuable will be the archaeological discoveries made possible by the British possession of the valley

# Mobilizing a Lady Bug Army to Fight the Aphis

(Continued from page 507)

and the thousands of acres of grain infested and the thousands of acres of grain intersect with aphids last season, the task before the beneficial forms and the numbers of them required become apparent" In cool weather, as has been said, the

bugs are comparatively mactive.

# Keeping trucks running

PIERCE-ARROW Trucks make good because they are designed to meet the strains they must bear, built as well as trucks can be built and tested thoroughly before they leave the factory.

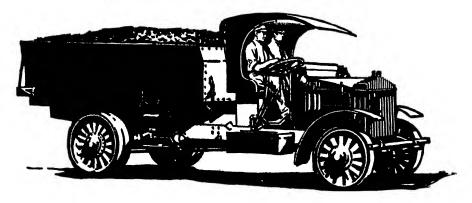

Then day by day they are followed up in the hands of owners through a nation-wide inspection service. Competent men examine the trucks in use and prescribe for their economical maintenance.

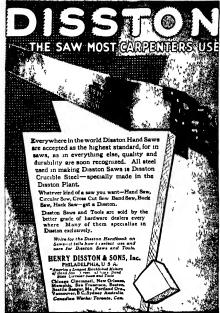

We believe our responsibility goes further than selling trucks. We believe in seeing that they make good.

# PIERCE-ARROW

ed from page 522)

Reproducing from eggs, they need warm temperatures to dovelop The aphis is under no such restrictions To quote this

same authority further "During the late autumn sexed forms of aphids occur and eggs are produced. These oggs hatch in the first warm days of spring The sphids hatching from mature in about 12 days and are termed stem mothers. They are wingless and have the unusual ability of giving birth to living young without sexual intersourse. They reproduce at the rate of one to sever young per day, the progeny maturing in about 10 days and in their turn giving birth to hving young at a similar rate the forms occurring during the spring and the ferms occurring during the spring augment months are these against females, capsile of producing living young. No true a viorus occur. After a few generation in the spring both winged and wingless form a occur. The winged forms frequently fly t new fields and set up colonies there

"It carly summer most aphids occupy ar 'alternation - of heat plant Migratory winged forms occur and fly to some new host often entirely unlike the spring host flues to the loop and constitutes the de-structive hop aphis. This habit affords prote tion from their natural enemies these nugratory forms may set up new color as in situations where the enemy is absent About 14 to 16 generations occur during the season 'Fall migrants occur in life autumn. These return to the host plant the species occupied in the spring Here true sexes are produced and eggs

deposited

1: m thus it may be seen that the men in charge of the lady bug experiment are facing difficulties of considerable magnitude These difficulties are increased by the fact when artificially handled there is considerable mortality among the bugs, In spate of this it is hoped that artificial on trol will prove effective, particularly in the dier climate of eastern Oregon and eastern Washington Experiments along cast in washington Pryperments along the same line are being conducted in California by the Horticultural Com-mission of that state in conjunction with the Bureau of Litomology, and with grafifying results it is reported

The experiments that are being made off in California and Washington will be wat had with interest by scientists and by farmers who are anxiously awaiting any me ins of destroying this serious menace to then crops

proportionately to the an density ower comer into operation at a low altitude and gains speed gradually until altitus at approximately 20 000 feet altitus fhe power of the engine, whill would be lost through change in itmospheric density, is thereby re-

It is interesting to compare the results achieved with this device as against the results without it. The engineers supply

results without it The engineers supply the following spenficant figures. The engine shown in the illustration on page 512 weight 459 pounds, and is rated at 210 horse-power at sea-level At 20,000 feet all titted, this engine normally develope about 100 horse-power. The engine with pounds and develope 210 horse-power at sea level At 20,000 feet altitude, however, the horse-power remains the same, analey.

The superiority of the first so, the second at 20,000 feet is re and should be noted. The small develops only smallest the seven larger at sea-level, But, accompand develops only uned larger at sea-lovel. super-charge fan, it develops slightly mare power at 20,000 feet. Moreover, the difference in weight is \$30 pounds, in favor of the smaller engine At this situtude the weight per horse-power is 25 pounds for the smaller engine and 43 pounds for the

It was a coincidence that within the last at was a coincidence that within the last few weeks, an item appeared in the news-papers announcing the development in Pans of a similar device, which has been designed by the eminent Franch engineer, Rateau, so well known for his work in the turbine field Detailed technical descrip-tion of this device has not been published, and such information as we have been able to acquire has been gleaned from an illustrated article, which appeared in one of the Paris newspapers

While there are fundamental difference between the American and Rateau superbetween the American and Rateau super-charge blowers, the functions of the two are the same, and the general application to the engine of both devices has been accomplished in a somewhat similar

The essential difference between the American and Rateau super-charge blowers appears to be in the method of drive The American blower is driven mechanically, whereas the Rateau blower is operated by a turbine actuated by the exhaust gases of the engine From available information, it would seem that the Rateau blower is generally similar to the American blower, consisting of a fan, operating at ap-proximately 30,000 revolutions per minute; the method of mounting and connection

to the carburctor is also very similar.

The exhaust turbine drive has received serious study on this side of the water by various study on this side of the water by various engineers, but as yot, the difficulties have not been successfully overcome. The bank pressure, which the exhaust turbine imposes on the engine, results in a serious loss of power and economy, and moreover, ioss of power and economy, and moreover, causes the engine to heat up with resulting valve and piston trouble of the most serious nature. The terrific heat is also very destructive to the turbine

The development of a successful super charge blower opens up enormous possi-bilities in the aircraft field, and it would seem that the future holds much in store for the successful application of such a device to all military and high speed ar-planes, designed to operate at high al-titudes. The theoretical possibilities of high speed at high altitudes are almost unlimited. In fact, the human element is the only factor that would seem to constrain progress in this direction. It is probable that the development of the super-charge idea will be applied to the human occupants of the plane as well as to numan occupants of the plane as well as to the engine, and imagination pictures air-planes of the future proceeding through the upper strata of the atmosphere, 30,000 to 40,000 feet above the earth, at speeds of from 300 to 500 miles per hour

# Pulling the Trigger by Finid Pressure (Continued from page 624)

naturalised in Eugland, and he applied to it a pinneigh in which he had just become greath; interested—namely, the trans-miss in of power through a column of fluid Because he encountered this principle while experimenting with sound waves under water he named it the "sonic" principle. He emphassizes that it is not as though the fluid were a rigid column, and emparted shock in the same way that a stedge imparts the blow of a hammer to a bar upon which it is held by a second workman There is actually generated, by an impact upon one end of the column, by an impact upon one end of the column, pressure wave-which traverses the rolumn at the rate of 1,900 feet per second, divering a blow at the other end, not instant un ously, but after the lapse of the mifinite sum interval aelied for by the velocity and the length of the traverses. doubtless their failure to appreciate that the outht did not constitute a rigid system that | pt the Germans from learning how to operate it -for its advantages are so marked that had they been able to unravel the secret they would surely have used it

onstantinesco's apparatus consists controlly as our drawing shows, of a copper pape filled with oil, at one end of which is a piston and of the other. which is a piston and at the other a push-rod to operate the trigger. The piston is connected with the propeller shaft by a gear and a cam. At the propeller shaft by a gear and a cam. At the proper matant in each rotation of the propeller, the hump on the cam drives the maton dear am drives the piston down upon the end tam drives the piston down upon the end of the oil column, which is under a pressure of 150 pounds. Through this compressed column the shock of the piston blow travels as a pressure wave, and when it reaches the other and it operates the hring mechanism the rotation of the propeller per s and with no friction except the

It is ut course not desired that the gun begin bring the moment the pilot takes th begin from the moment the pilot takes the art, and continue until the makes his land-ing and stops his engine. So some means of control must be provided, and this is made possible by the necessity of having the oil column under pressure before it will fram unt an effective blow. A small chamber is provided, connected with the copput pure, and normally the oil occupion When it is discrict to set the jum going the pilot thinks a semall liver connected. with his joy-stick, and this, with the aid of the spring shown in the reservoir, expels the oil from the reservoir, forces it out into the pape and puts it under pressure there—I ben things begin to happen in the oil column, and the gun begins to speak

### Selling Woodworking Machinery Abroad

(Continued from page +14)

'Irance is not likely to buy very much American woudworking machinery because of the activity of Irench manufacturers A much better opportunity exists in Ppain, where there is a decided preference for American machinery, carned by the high quality of that imported from the United States We expect spirited competition from the British and French firms, however, and from several factories in the Barcelona and from several factories in the Barcelona district Italy offers a most attractive market. The use of woodworking machinery in Lombardy is extensive, the furniture, wehich and building-material industries being well developed. Before the war, 70 per cent of the imports were supplied by termany. Our agent was told that one terman firm gave some of its customers one terman arm gave some or the communi-thric or four years to pay for their pur-chases in easy installments. We have decided to appoint a general Italian agent at Milan to handle our business."

With the development of its railroads and sufficient immigration to increase successfully its supply of labor, Brazil should become one of the world's principal its W. Festerses, B. Ezhmison, Sho.

Till mention of castor oil provokes a reminiscent protest as a rule associations which most of us would rather forget and yet today, it is brought home to us that this particular oil is of outstanding military value especially as a lubricant the engines of aircraft of all sorts

Lirly in the year the War Department and the Department of Agriculture joined fore s m an energetic campaign to induce the furners of certain sections of the of quite 100 000 series of easter bean plants and as a consequence of this patriotic appeal to our tillers of the soil 108 000 acres were actually sown. The urge to this iction was the need of something like 5 ion 000 gallons of castor oil for the natire highling flying machines

I stensive experiments carried on by the of Arcrait Production of the War Depart-me t proved conclusively that easter oil we the lubricant par excellence for fast-runing, motors for acrial service. Up to pent various blends of mineral and very tible ods did well enough but none of these was found capable of answering the surreme tests of sustained flight under a with range of temperature and varied all sphere conditions value someall sphere conditions vature somethu teristics that were singularly and strikingly united as if the wants of mechancal flight had been currously antica pat d

Why it may be asked are the needs of the aircraft motor any different from other high speed engines? Strictly speaking the To pure ments are not essentially dissimilar so long as the surplane travels close to the ground and there contends with much the same conditions as the prime movers of a ruing automobile. But the moment the flying machine mounts skyward the physical circumstances under which it operates ate tade ally altered the atmosphere in the course of a few minutes may change from a temperate to a very frigid temperature and not only that but the baron ture and not only that but the paroine-or, pressure is lowered directly, materially affecting the propulsive power of the gaseous explosions within the cylinders. Again in order to get a maximum of the color of the color of the cylinders.

driving energy with a minimum of weight the designer of the aircraft motor has ligd recourse to aluminum pistons functioning within cylinders of special alloy steel. Therefore in order to protect the much softer aluminium from the abrasive action of the neighboring walls of steel and yet to insure a snug chough fit to prevent the premature escape of the expanding gases, it is imperative that the two metals be continually separated by a film of oil only that but the lubricant must not be thinned out by the intense heat of the tunner out by the intense near or one combustion within the cylinders, it must retain its body hold its place, and yet possess anti-frictional properties of a high order Lakewise the oil must not carbonize of foul when exposed to the explosive I maily the lubricant must main tain its fluidity even when exposed to the effects of intense cold for otherwise it effects of intense cold for otherwise it would fail to flow from the reservoir on to the pump and thence through the various pipes to the points or moving parts to be

If the flying machine could stop or return to earth in safety whenever the engines bilked or the oling system went wrong, probably numerous other fubricants might d) well enough But the airplane, pardo well enough But the arplane, par-ticularly the multary raft, must be able to stay aloft for hours and hours, and to travel above enough territory with a reasonable chance of escaping destruction or capture because of engine breakdown. Contanous ervice for a hundred hours is demanded of the motor before mechanical overhauling of a material degree is necessary To achieve this mobility it is indispensible that the lubricant be of the very best and susceptible of standing up to its work no matter what may be the weather or the oution of the mercury in the thermometer.

The Castor Bean and Its Many Uses Nothing else meets these manifold conditions but castor oil

(astor oil, so it is said, has the highest specific gravity of any natural fatty oil and is unrivalled in its viscosity, i.e.

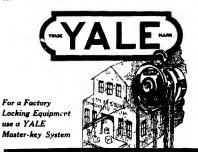

and is unrivation in the vessionity; i.e. body, by any other known natural fatty oil. Not only is it singularly unresponsive to high temperatures, but it flows freely until it freezes at a temperature between 15 and 20 degrees Fahrenheit below zero I urther the oil keeps remarkably well even after an exposure of several years to the atmosphere These are the physical reasons for the choice of easter oil as a lubricant for the engines of aircraft

Popularly, this use of the oil seems ! sudden discovery and the diverting of the material into new channels of service previous employment, as the average lay man understands it, being mainly limited to medication As a matter of fact, castor oil as a lubricant has been doing its helpful bit for a good many years in various parts of the world, and has been doing its work well at that Further, the industrial arts have drawn upon at latterly to a generous extent, but don't let us anticipate the story we have to tell Until about 1900, and previously for quite four decades, castor ans were raised in considerable quanti tics in parts of Oklahoma, Kansas, Mis-souri and Illinois and earlier still the plants were grown to some extent in Virginia North and South Carolina, Georgia Kentucky lexas and California In the days of the domestic plenty of the easter beans they were utilised in the making of oil both for lubrication and for medicine but the industry dwindled rapidly after 1900 when our farmers found they could raise other crops that paid them better and mineral lubricants said competing castor beans from India emphasized the of this course on the part of our husband-

In India the castor bean has flourished naturally for untold years and has been cultivated assiduously for a number of decades Just how many bushels of castor beans are harvested annually in India is not recorded nor are her exports of ca beans and oil an index of the measure of the ndustry simply because the people of Indiantry simply because the people of India use enormous quantities of the oil for domestic services. However, there are some suggrative figures available. When the various countries of Europe began to realize prior to the war the value of castor oil as an airplane lubricant oil as an arpiane numerous one common upon India nureased steadily During 1913 and 1914 preceding the outbreak of strife Germany doubled her prevous imports of both castor beans and castor oil from India, and between 1914 and 1915 the from India, and between 1914 and 1915 the Indian raports of the oil amounted to nearly 900,000 gallons, while during the interval between 1918 and 1917 she shipped away about 1726,000 gallons During the present year, Great Britain commandeered the entire exportable supply of Indias castor beans, in order that she and Illiud and that she and her Allies might have the fullest possible measure of the lubricant for their senal squadrons

It was this situation, with the prospect of a very large air fleet of our own, that impelled the U S Federal authorities to urge the extensive cultivation of case beans in this country To help us in this venture, Great Britain released for seed venture, Great Britain released for seed purposes a matter of substantially 6,330 long tons of Indian boans The Depart-ment of Agriculture painted rather a promising picture for the encouragement of departure. phonomany picture for the encouragement of domestic growers, and announced, in effect, that the farmers might expect to harvest anywhere from fifteen to forty bushels of beans per acre, and the Government guar-anteed first \$3 50 a bushel and then, some anteed first \$3.50 a bushed and then, some months later, rassed the price to \$4.50 a bushed. It is unfortunately a fact that the foreign seed, esseancal handreaps, and possibly the general newness of the under-taking have operated against the hoped for results, and, taking the industry here, by and large, an average yield of only five bushels to the arre has been achieved. This does not augur well for the future if

For a though the constitution of war modify the regency of a great supply of castor oil, at is undersable that the commercial and sure uses of the flying machine together with the military aircraft that we shall suitely have to have will call year by year for increasing amounts of this lubri-eant. And whether or not it will be worth

while for our native growers to continue in the business will depend in the main, or developed for castor oil and the by-

products of its manufacture

tee ording to the grade or stram of the beaus they contain anywhere from 46 per out to 53 per cent of oil, and of thus 33 p r cent is commonly yielded by the first expression. This is a cold process, and the oil so obtained is that which is devoted to pharmacy and to the high-grade lubricant calle I for by the flying machine as well as the racing automobile. Subsequent ex-pression gives 7 per cent of addition oil and it is possible to increase the total viold by treating the oil cake with a suitable sol-It is the belief of some of the manu fact ir re that much of the second grade oil would answer even for surplane service

And now what are some of the uses to

which caster oil apart from that of a lubricant for air craft is put or may be turned? Ordinarily we require here yearly about 1 000 000 bushels of easter beans, and only 25 per cent of the oil extracted, if quite that much is consumed in the various departments of pharmacy. The other fields of employment are much more ext usive than most of us realize For in the monufacture of substitute or arti-ficial leather which takes the place of natural leather in the upholstering natural teather in the uphoistering castor oil is an essential component in some artificial rubbers and there are various kinds of colluloid which depend upon the product of the castor bean Castor oil furnishes a very satisfactory coloring for butter, and from easter oil is produced the so-called Turkey-red oil, whi is an important factor in the dyeing of textiles and in the treatment of the fabrics. One of its largest uses is in the making of transparent soaps Castor oil stears and in the manufacture of candles and from it is also obtained capryle and while lends itself to the composition of varnishes peculiarly suited to the polishing of all kinds of high-class furniture, carriage bodies and paintings and is extensively employed in the preparation of vellum, tracing cloth etc. Caprylic acid plays a part in the production of others which are used by perfumers and confectioners Castor oil is used in the making of certain waterproof preparations, and a liquid dis-infectant is obtained from the "seconds" or lower grade oil The oil is an admirable preservative for various kinds of leathers. is extensively used in the leather industry, and is particularly serviceable in adding service life of leather belting em ploted in heavy work. Our fly papers would not be so effective if it were not for east or oil and the oil enters into the get

cast roll and the oil enters into the get-up of a great many adhesive agents In the sugar mils of the West Indies, upon the railroads of India and other parts of the Far East, and in British shipping circle castor oil has long been used as a mechanical lubricant, affort, however, it is generally blended. In India the oil has been found to be an economical and Doen found to be an economical and Deterrist stimutation support illuminate—gying a markedly glab micro-organizms and the galvanic bulliant flame Indeed, the peoples of action of the current on their beddies in India have found ways to utilise the oil and the refuse ponace which may suggest. With the above proven facts in mind, other currence here in the future. The is it at all surprising that encrimous in-ponace contains from 6 to 7 per cent of creases in production have been reported or introgen and as measurable amount of where electricity has been properly applied potash, and it is authorizatively said that to this new art of promoting the growth of the castor-ecod calca concesses 25 in ere cent vesestation?

from the seed care after the ou has been extracted for other purposes. Notwith-standing the pretty general belief that the easter bean plant will not be touched by cattle, it is stated as a fact by competent authorities that the leaves, not the stalks are widely fed to cows in India, and an added yield of milk is attributed to this added yield of milk is attributed to make forage. In Assam, the foliage of the caste bean is cultivated largely for the purpose and an excellent of feeding silk worms, and an excelle paper pulp can be made from the plant

### The Theory of Electro Culture By Robert D. McCreery

IF we believe in the ionic theory of Electrolytic Dissociation we are con-vinced of the fact that when an electric current is driven through an electrolyte there is produced a movement of the "ioms

that carry charges of electricity
In the use of direct current the negative ions move to the positive electrode and the positively charged ions move to the negative electrod When alternating ourrent tive electrod. When alternating current is used the ot the case, the ions move rapidly first in one direction towards one electrode, then in the opposite direction towards the other They are as it were in a state of intense vibration of an oscillating nature, caused by, and in unison with, the waves of the alternating current

What then happens if we discharge high frequency electricity through an acre of soil to metallically coated seed, from electrodes (parallel to each other), em-bedded in the earth?

The earth is in this case the electrolyte, in which by the action of water, there have been gaseous ions set free When the In which by the scott free When the electricity is applied, these ions set up an active bombardment on the seeds and tiny roots of the plantlet and since the see and roots are porous it must be evident from a mechanical standpoint that some absorption, by the plant, of the gaseous ions takes place. After being absorbed by the plant roots these ions are still subject to the influence of the high frequency electricity which, during application, will set up vibrations within the cells of the Such an action will mechanically enlarge the cells in the tissues of the plant

and allow it to grow more freely

The discharge of high frequency electreity through soil is also equivalent to
seration since it causes air to be drawn into
the soil with it. This is us a great measure
the principal benefit derived from cultivation and is, therefore, an important factor in agriculture because of its stimulation of erial action

hacterial action Moreover the discharge of high frquency electricity through the air combines with the moisture in the soil to produce nitrie acid, which contains nitrogen in a form readily available as plant food. On the other hand the electronic collaions of the ions with alkalues in the earth recoluse nutries.

matons of the ions with ascause in the earth produce nitries. The earth in a sense becomes a storage of nitrogen that must be deanged by the soil bacteria before it becomes available as plant feed. Thus makes work for the soil-building bacteria. In 1009, Prof. G. E. Stone of the Massa-

In 1909, Prof G. E Stone of the Massachusetts State Agracultural Cellegs, proved in a series of teste that by discharging each day a few sparks of state electricity through soil containing bacteria, these organizams in 17 days increased 600 per cent. There is another influence of electricity on the bacteria which might be termed bacterial stimulation. Bacteria are shuggash influence organizams and the galvanic days in the contraction of the series of the series are shuggash influence organizams and the galvanic series.

### How an \$18 deal on a heifer grew into a great nation-wide business

Fifty years ago there lived on Cape Cod a young man whose sole capital was \$18 and an abundance of energy.

His money he invested in a heifer his energy in dressing the heifer and selling the meat to hungry Cape Codders.

The young man was Gustavus F Swift, and out of his \$18 deal eventually grew a great nation-wide organization.

It is an organization built up gradually from its modest \$18 beginning by putting cash into the business, and by saving and reinvesting each year a part of the profits, which amounted to only a fraction of a cent per pound,

The shareholders have been content with reasonable dividends, and have been willing to allow the remainder of the profits to be used to expand the business and the service. as the country has grown.

The fractions of cents that have been saved from annual prof-tis have helped to build new packing plants as the demand for mest grew fractions of cents have financed new branch houses to supply vital needs of distribution—fractions of cents have built refrigerator cars to make fresh meat regularly avail-

It is difficult to imagine any other method of building up a vital business which would involve so little hardship to the people of the country.

If Swift & Company were to eliminate its entire earnings these fractions of cents that have built packing plants, branch houses and refrigerator cars — the price of meat would be practically unaffected.

# GMC Quality Its Own Best Proof

When a product is built inherently good—good for its own sake—that fact will inevitably impress itself upon the minds of users and prospective users.

This is on the principle that truth will prevail. And this is the principle underlying the rapidly widening reputation of GMC trucks for plain, honest quality.

No motor truck can establish for itself lasting confidence unless its quality is proved by use. No business can become truly great and permanent unless founded on a sound and legitimate basis. So GMC Trucks are fast reaping the benefits of true quality—that genuineness of merit which reflects the high ideals of the builders.

GMC quality is fighting its own battle against every approach of inferiority.

GMC trucks are not only good, but able to prove it in performance.

That users keep on buying more GMC trucks is evidence of this fact.

Let your next truck be a GMC.

Be quote and quete work

### Crop Growing on Contract

ROP production on contract as American farmers will grow wheat the coming season, the United States government guaranteeing a stated price for the entire crop, m new in agriculture a war-to emergency measure which will not likely be repeated, but crep growing on private contract was in practice before the war, has been und by extended, and will un doubtedly become of great permanent importance. It is not generally known that the entract system is followed exclusively in the best sugar industry the scope of which in the American West vastly increased during the war that factories causing sweet corn, peas, tom toes and other vegetables invaliably sign contracts with growers agreeing to take pr in thom at a stated price before the seeding season that dehydrating plants vinegar manufactories, picking concerns and lam manufacturers find the system in indepensable part of their business. The vast seed-graving industry of the United btates is operated very largely now on a contract basis I xtension of the contract the overywhere makes for stability in agriculture It his materiak and speculation and is heneficial alike to go u r and buyer. No farmers in America are more pring r ris as a class than contract growers who know before ti scann starts to whom they will sell their grop, what | 11 they will obtain, and who in consequence can devite their whole energies to improvement of cultural methods and attainment of maximum production

When a crop is grown on attract the farmer nearly always een make convenient arrangements for handling it either through loans due, if the contracting company or of a load bank in win his company is a heavy deposited contracting impunes like the best sugar manifesturers generally have held men expert in production of their special or pick give free assistance to fainter to he companies at the former in companies at the former in companies at the former in curvay way; as all stucces even finding labor for him. It is a ray, they have not dwestern best on the former in curvay way; as all stucces even finding labor for thimmag and the just mag exason work and in the full for pulling in it; pung. These workers also are on contract in that case with the farmer performing works are on contract in that case with the farmer performing works are on contract in that near with the farmer performing works are on events are the contraction.

In January this year ( I rade sugar best growers were signing contracts f r the 1919 crop at \$10 a ten in thousands of other thin r and i children growers were signing crop contracts it [ rues which practically surranteed them a profit lik year.

In the Pacific Northwest the entract plan has recently been extended to exchand our . At so much per

are, management synds it is prime spray interrop harvest park and shop the four of rehards. Some such contractors have several hundred at rec under their care A large part of A nor a whole malk as sold to sty distributions on prace contracts in smoothly or longer. In New England the enter barponning process is between the erty distributions and an association which represents thousands of producers. The France Valley Milk Producers Association of the Northwest is not large by mambership representing only about 1000 distrymen; yet it alls over a mallion dellars worth of milk a year on

contracts between it and dustributors. The contract plan substitute for a problematical market a certain one. If the farmer thinks the price offered is not low, he not 1 not give the crop a fact which in itself practically guarantees a profitable quotation. There are obvious, hints to the development of the contract crop idea but within its own sphere it is fine humans for sell instruction concursed.

### The Fighting Ships of the World

THERE was evalue of during the past four or favy years that num a naval enthusant was trying to keep not les record of the game and losses of the national that ware engaged in the Great Myr—a thankinet take is must of them sooner inker discovered Such facts or supposed facts as were discovered Such facts or supposed for supposed facts as were discovered for government censorship concealed or disclosed losses secondage as it was fit.

With the signing of the armstere however, oil the governments showed a wilcome and much-appreciated liberality in the matter of naval information with the

result that the various naval annuals that see Making their belated appearance are able to place believe tuples a remarkably complete stetement of the present standing of the naves of the world Completes these publications is Janus' Flighting flaus" for the year 1918 the appearance of which marks the twenty four year of suce of this weakly-known work. Th delay in its appearance was due to the fact that one-half of the book, comprising the British, German, Unsted States Japanese, and Frunch sections, was not released until the consorbing of naval information cause to as eed The delay was not without its advantages, since it embied the publishess to include a Supplement despite on the new terms of the delay was not without its advantages, since it embied the publishess to include a Supplement despite.

In its general makeup and the complessesses of its information, this volume is generally similar to those with which we were familiar bothers, and curring the early years of, the Great War. It compress nearly 600 gas of mormation, and with the acception of the British and United Blates navies, there are the usual half-ton-engaryangs followed by Jans exception of the British and deek plans and the armor and gun distribution of the principal shape. Twenty-one pages are devoted to a tabulation of the ships lost in the war, which is rendered particularly valuable to the historical by the insertion after each ship of the date and obvioustances attending its loss. If m a grueone list starting with the British less of 5 hattle-rusers 12 battleships, 12 armored rusers 9 protected and light crussers, 8 monators, 81 destroyers, 5 torpedo boats 25 or more submarines, and 57 merchant suturbares. Compared with this, the fiest of the United States comes of very lightly with a less of the United States comes of very lightly with a less of the United States comes of very lightly with a less of the United States comes of twenty-separate of torpedo boats 15 submarines and 9 mercentiles auxiliares. A more of the submarines and 10 mercentiles auxiliares. A forther of the submarines and 9 mercentiles auxiliares. A forther of the submarines and 10 mercentiles auxiliares a Legal on the actions; 2 hight crusser, a product of the crusser, a product of the crusser, a product of the crusser, and a submarines and a submarine with some vectors of annuller unportance and a submarine with some vectors of annuller unportance

At the time of going to press the editors of 'Fight ing Shps were in some doubt as to the extent of German losses in expital shape and the probability is that it appearance of fellicos work and access to later in formation will provide us with a more exact statement in the 1919 issue. The bettleship loss is set down intentitively as halps and it is definitely stated that the Gernana lost one battle-crusser, 6 armored crussers Is light crussers 45 or more destroyers, 14 or more torpoids boats and over 150 submarances. Admiral Sims has recently stated that the total German loss in submarance were also (set Austras is credited with the loss of 3 or 6 hattleships, 9 light crussers 2 monitors a doson destroyers and torpodo boats and 13 submarances.

The inclusion of the naval conditions of the armistice both for Cermany and Austria-Riguagary will be approciated by historians who will find the book to be a valuable work of reference particularly as it includes the

cated by Antorians who will mel that moote to be 8 vales of reference particularly as it includes the terms imposed on the lesser powers, Turkey and Bulgaria Although his Bupplement on new Bettish war construction contains no photographs or line cuts, the test is complete as far as it was available at the time of feron It is a foregidable lim', including the great crusser battle-ship "Bood", the so-called "hush" allaps, and various inch crusser, conditors, destroyers, and submarines most of which have been illustrated and described in the Ecurety-Austrian.

The public as a rule do not appreciate how greatly the strength of a navy is related to the suitabor and excellence of the harborn, naval bases, dry dods, and other shows facilities. One of the best features will explain a supplication in the excellent charter of the isoding harborn, navy yards, ste, with their facilities, which precedes the obspice devoted to each navel power. Jane's "Fighting Shipe" in seconomy with all judicactions of its class was hard hit by the war, and we are glad to see the promise in this first sense after the war that it will continue to making a self-camed regulation.

The present editor, Mr Maurice Prendergest, assures us that the 1919 editors will appear at a moth earlier date than this serse and that it will do full justice, by text and illustrations to the British, United States and

### Electricity Astr

Electric Arc-Welding Nomencienture.—In order 1 standardies the various types of electric well employed in shipbuilding work, the Welding Committee of the U S Emergency Fleet Corporation have prepared a chiert describing these by means of symbols For meanes, a strap weld us denoted by a small cavia, a but weld by an equilateral strangle, and a filled by a letter inverted Stinslasty, the design of the weld, whether angle or double wer or bowal, at poneton, the kind of wide-took weld, strength weld, etc.—and the finals of this world, are all indicated by symbols The adoption of this code has been melapomentole, and enables all the requisite instructions to be quantity are strong to the world, strength well, and enables all the viction specification to the working drawing in a veryignali space as compared with a viction specification.

American-Built Lafayette Wireless Station in Franss.—The sale of the great Lafayette varies station at Berdesuut to the Frunch government at a price of approximately \$4,000,000, and many hithert unpublished facts of American naval scientists in the war, we announced recently by Assatiant Secretary Roosevelt "The great Lafayette radio station near Bordesuu was intended to faure communication between Washington and the Army and Navy, in case the cable system was put out of commission or interfered with by German submarines," Mr. Roosevelt and 'It has eight tower and could commission to interfered with by German submarines," Mr. Roosevelt and 'It has eight tower and could commission to interfered with the German colonial state of the commission of the United States day or night It was built by the Navy I savanged with the Frunch government that we shall complete the station, which is two-threds finabed, and they will than take tower at what it counts us, about \$2,000,000 frames "

Trees as Aurials for Wireless.—It is difficult indeed to find something really new in radio communication. Things when he see hailed as new in the daily press are more often agt to prove merely developments or in-provements along well-known lines, and it is in that class that the recent tree serial tests at Washington, D C, fall & after both as 1907, experiments were certained out which trees were employed as serials. In the recent tests messages were received overflutte a characte by message of tree serials. It was also pointed out that messages were received through the agency of tree serials over short distance. However, in view of the spearchably sensitive receiving apparatis available today, the use of tree serials no more remarkable than it was back in 1907, with the relatively crude metruments of that tion.

Electric Henters in Swedem.—The use of electricity for heating purposes as comparatively zero, but ame the scorages safety purposes and the secondary to the secondary series of the secondary telephone and Norway has been more said more extensive in freedings of the damag the war, decirno heating has become more and more extensive in freedinary has been manufacturing electric heating appearates in the beginning this factory employed 40 mea, but at the end of 1917 the number was increased to 500 Extensions are now being made which are expected to be faished in the fall of 1919, when the number of employees will be about 1,200 The factory makes all hands of heating apparatus for cooking, roung, and so on, and all mind apparatus for cooking, roung, and so on, and all mind of lamps and heating materials. All of which is by way of showing how certain countries are developing their water power to the tutnost extents

A New Type of Selective Aerial.—An ordinary sarial responds best to incontage agends whose frequency clonedes with their of the norial, but it will also centilate at its own jurisd when central by selections agreed waves the same of the selections of the selection of the select

### Astronomy

Jerome Coggie, whose name is attached to the great control of 1874, recently died in France where he served as assistant at Marseilleu Observatory from 1806 to 1917. He was the discoverer of seven cometa beades the one that bears his name, also of fiv minor planets

The Adolfe Stahl Lectures in Astronomy, delivered in San Francesco in the Rasons 1916-17 and 1917-18, under the auspices of the Astronomical Rosesty of the Pacific, are to be published in book form, with the aid of funds furnated by Mr Stahl The loctures have been revised and brought up to date so as to constitute a valuable digest of information on various astronomical topics down to the close of 1918

Metacottes in Tarcitary Strata—It is suggested by Metare that the notable absence of rac opmassible meteorias from the series of stratified rocks is possibly due to the rapid disnutegration of the meteors unbatants, which even in museum collections shows a deplorable tendency to decay. It is stated however that the Britash Museum has reacetly received a slice of metrors on with the aformed at a place near Dawnou, in the Klondsto, and which, like another meteorie iron previously found in the same sudgheborhood was juring deep in carcian gravals believed to be of Phiceons ago or older Canadoan prologists believes that both objects formed part of a single meteor shower which took place in Tertitary times.

Beta Cygial Probably Tripia — I he beautiful doubs tear Beta Cygia (Albiro) a well known to the users of talescopes. The fatner component is if seconds from the primary, and that relative pastimen of the two objects have not basped appreciably during this century or more have not been proportion. Became the proportion of the primary components observations. Became pastiments of the beighter star made at Lief (Descriptor) have confirmed the auspition previously entertained that its radial velocity varies. As the star has a composite apactrum, corresponding in general to that of yellow dars such as Archurus or Alpha (asstopsia, but also abovering the strong hydrogs in loss and the weak and narrow K calcium has characteristic of many blus star, such as firms, the variation in its radial velocity is most plausibly explained by regarding it as a spectracoppo binary. In other words, Beta (yran is probably a triple star. As the colors of the two stars sees in the telescope are yellow and blag, flasty contracted, it is interesting to learn that the spectroscope pair also conmists of yellow star and a blus star.

A Complaint from the Seuthern Hemisphera-Mr C H Trup, of Thana, N E, writes to the British Agronomoual Association to complain of the common parties of agencia the nonlinear homophers in certain statements commonly found in books on astronomy. For example, we constantly find runs of the sun, mose, plands and contributions, labeled as seen with an inverting telescops! It would be proper to add the words in the northern hemisphere, since on the southern all these objects are seen upside down to the southern all these objects are seen upside down with the proper to add the words in the northern hemisphere, since on the southern all these objects are seen upside down with the proper with the northern view of them, and the mivring telescopy restores them to the positions in which they are seen with the nated gvis is northern justice. Another common error, says Mr Tropp, as describe the sun as always seeming to move in the dissociation of the hands of a watch. In the sorthern hemisphere the sun a spperant movement is just the opposite He state that were experienced instrument-unless become confound on such subjects and end to southern astronomers equitional mountaings for telescopes with the right assessand rous a firm in the northern hemisphere, and might easily lead to expeasiry mistakes if the turbines were to be used down of the same are and an and to be used south of the same and the same firm in the northern hemisphere, and might easily lead to expeasiry mistakes if the turbines were

### Automobile

Closed Bodies Popular - I here has been a marked tendency in the past few years toward the varieus enclosed types of motor cars for all the year round use. especially favored models being the coupe and siden with easily removable windows for the extreme hot weather when every breath of air is acceptable. The permanent top types have a big advantage as the overing serves to protect the motorists from the heat I the sun as well as the inclement weather it was originally designed to shield against The top when all windows ar down netually creates a better flow of air than is present in the open cars because the air currents are confined and directed against the passengers material of being dissi nated, as in the open car models. The folding top or landaulet types of enclosed bodies are also very pop because one can socure the maximum degree of tion offered by the enclosure and in a very brief period, by dropping the windows and folding the top one can due all of the advantages of the open car forms

Special Tools for Auto Repair Men -1he production of enormous quantities of popular priced automi biles has created a new industry and that is the production of special tools jigs and fixtures for making repair work easier on these cars In the early days, the rerman was forred to make his own special fixtures and it was not often a profitable thing to do because it was seldom that enough cars of one make would be received for repairs to warrant the expenditure of money and labor Now conditions are changed and so many cars of certain popular makes are used in cvin small communities that the service station is justified in stocking certain fixtures I ven the smallest shop includes valve ead and seat reamers valve granding tools bushing extractors gear pulkes and other devices of that kind Shope of greater pirtumons can now obtain engine sappering stands special cylinder boring tools, re-babbitting igo piston chinks minering rods aligning fixtures and numerous others that reduce labor and repair costs and yet that can be procured at much lower cost than they could make the devices in their own shops because they are the product of specializing manufa turers The desirability of having work done in any shop where time saving fixtures are used is apparent as the intelligent motorist realizes that he is not paying for wasted time when special tools are employed on his It may take a certain class of repairman several hours to drive off a gear from a shaft often with serious consequences to both members. The real med uses a special gear pulkr that accomplishes the work in one quarter the time and without danger

Leading Maker Adopts Dual Valves -- For some ame past considerable attention has been paid to rents of engine design that would increase power without calling for augmented piaton displacement method of doing this that has been used for a number of years in racing automobile and aircraft engines has been the use of dual valves t s, two exhaust and two intake valves per cylinder instead of the conventional half that number. In order to give superior high gear perfe mance or greater flexibility some makers of four cylinder stock cars have used this feature in their regular product It has remained for a large company that is an exclusive builder of sixes to adopt this feature on stock models, to meet the public demand for better performance on the direct drave To satisfy this in their 48 horse-power model, the company built various types of mx eight- and 2-cylinder engines and because of these experiments tuey are now convinced that a six-tylinder engine is the I great type for passenger vehicles It was discovered test the greater power output of the newly designed engines, especially at the higher speeds, was due almost entirely to the size of the valves employed in proportion to the cylinder displacement volume — In order to obtain as great valve capacity in the ax-cylinder 412 by 514 ini h engine with which its 48 horse-power model has been quipped as found in the high speed forms they develd it would have been necessary to use 3-inch valves with a \$4-moh left With a greater left, of course a smaller diameter valve would have sufficed, but it was figured that 3y-inch was the maximum lift which would ermit of reas onably quiet valve operation, so the logical solution was to use a larger number of small valves Under the old system of nomenclature the seine would have been referred to as a 24-valve design

# Cleaning Up After the Submarine War

# Bringing the Ships of Our Merchant Marine Back to Peace-Time Condition

Pill results of the way of terman U beats upon marchant shipping are to be an essured set merely by the shipping are to be an essured set merely by the shipping that be a mean of the set of sinker adapt that be upon the oran bed to in a very large (tonings whi is though topid and more or less hadly wristed was able to get near enough to a friendly coast to be backed in such as the same of the set of the

and uninstantial imposes since I of the fee home were any well found shipping varied that is devoted to general day shock and repair work, in the well realize what a large amount of time and money by we been expended and are still in a large measure necessary to bring the merchant shipping of the world back to peace-time conditions. You will find such yards beavily congested with shipping chelly of the conditions which yards beavily congested with shipping work of the conting and pounding up to the more remoistank of making structural changes involving the cutting waves of trapporty steel work and the removing of structures give the which was it stabled as part of the suit means defense equipment.

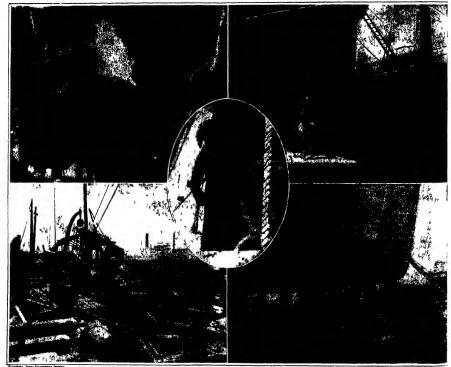

lowards the close of the war probably every merchant ship was almed for defense. The armament consisted in most case of a single gain mounted antern but in the large possengis ships included a whole battery of divergence in the gains. The ships of our own merchant marine were equipped generally with a least two gains one mounted on the forecast is dek and the other aft on the quater disk for poop. Now morder to get good command fleight above water for the gains these were usually carried upon special stict platforms built of angles channels and plating which in order to take the law yereoid of the gains had to it built of great strength and stiffness. Who this wire last one cut away and longer above and the decks and superfuretures re-

hosted asbore and the decks and superstructures restored to thur peace-time continuous.

A large proportion of the ships also were provided with the elebrated paravanes which were recently described in the Schenzerie Versites. These accessing that the third pand of special books - ratingers to say nothing of the heavy paravanes (it) - levs and the habings and gar that went with them. # Reconstruction in the United States

# The Work of the Reconstruction Research Division of the Council of National Defense

By Our Washington Correspondent

I is a strange anamol that the government with the keat officially form unisted plans for reconstruction should have better information and more of it regarding the subject than any of the governments of the war redden countries of lutings. Yet the work done by the Reconstruction Recarch Division of the Council of Ashound Defense has placed at the disposal to the of the government and the husaness francistal and many facturing cities of the country a more complete complished of reconstruction information than can be found any where its, in the world

initiation of reconstruction information than one be found may where its in the world.

The same of the Reconstruction Research Division are two to gather and make available the information acceded to yield perspective for the exercise of retional judgment of the souther a practice in the contraction and also to furnish has kere und for the passing of judgment of the contract upon reconstruction and also to furnish has kere und for the passing of judgment upon reconstruction process and to been intended and accessible the vital information upon the play made has not other reconstruction of this nation which has been oberitanted by the various was bosonic with his period of heart programment less up to date and perfect the possibilities of the contraction of the process of the

needs of pour and especially to meet the requirements of any industrial and social emergency incident to reconstruction which might arms and call for governmental in-

The word reconstruction is frequently used to include all readjustments all resettlements an new work in rearrangement the world or any part of it. For clarity, it is better if a sharp distinction be made between problems for readjustment and resettlement which include nothing more difficult or new than a going back to peace conditions from a war footing, sholishing those regulations and practices which war made necessary and generally getting back to normal and those other problome which are truly reconstructive w ions when are truly reconstructive which come into being because many have discovered that it is neither possible nor desirable to return completely to a status gue and, and that now ideas new practices, new laws regulations and proceedings have new news regulations and protestings have grown up during the volenic eruption we call war, which must be retained even if modified, if we are to make progress forward and not backward

Almost mvariably readjustment or re Almost invariable readjustment or re-settlement problems come before those of reconstruction proper. Thus, before it as possible to rouganise an industry, it is necessary to get back the men who run it Henre ulmobiliration is a resettlement problem rather than one of reconstruction to the problem of the problem of the problem. But if it is planned for instance to con-tinue to utilise the labor of women where

time to usuate the latter of women where control only men were supplyed then the problems of making places for both men and women, of creating new standards of both work and wages with their consequent effect upon production prices are problems of reconstruction

It was obvious to the Council of National Defense It was obvious to in tourist in vaccinat between that no resettlement resignaturant or reconstruction could be properly undertaken or best carried out if there was not available all the knowledge information and practice which could be gathered together. No man works as well in any labors as he who knows all there is to know of what the culer fellow has done, what other himself and the country which the country which the reserves are planning to works as wait in any isnor as ne who shows at these to know of what the other fillow has done, what other workins are dong what the research of the should be an extended to the should be a should be done and the should be a should be done and the governmental machinery has show one-half of the governmental machinery for the showledge or competence of the control of the showledge o

available as knowledge as to 'who knows the most about it the Reconstruction Research Division is serving the mired public and is able to effect the mandestrees, hankers, business men—to say one really interested in any resettlement readjustment or reconstruction problems a waith of material obtainable nowhere cles in the

world
Not to estaing all its resources but to indicate something
of that range, a 6 w of the possibilities of the information
review as the reason summarized. The Divisions is dearing all
rederal bothes having contact with denoblisations or
reconstruction, and possesses first-hand, up-to-dete
information as to the accomplishments and plans of each
such body or burean. If havolagh its field service 'iscluding 184,000 state, countly and community organisterior (moluting 18,000 women's units) the Division
making the contract with all state and local reconcentures. tion activities

The Division has every important report of fores ton Livinon and every important riport of trenga reconstruction activity proposed or accomplained, that reaches this country It has the best information there is on foreign commercial, industrial and financial conditions and prospects

The Division is in touch with all the war administration boards bureaus, and investigation commissions, as

THE prime purpose of the Reconstruction Research District of the Council of National Defense us to tap all markable sources of information in this country and abroad to the and, first, or interest of the working definition of reconstruction and readjustment, and the printing of a working definition of reconstruction and readjustment, and the printing of a working definition of reconstruction and readjustment, and the printing definition of the through the state of the part of the source of the total part of the total part of the source of the total part of the total p

well as with all bederal Departments. It has much uspublished statistical information ranging all the way
to describe price data and production estimates,
the data labor supply reports and the reported
results of experiments in methods of handing labor
problems—to notes of foreign production the foreign
labor and emigration situation, foreign market conditions,
and finance. The Division knows which industries are
making reconstruction readiguisticates the more promisnight, and thus can form much more reliable impressions
as to what the future may be expected to henge, than is
possible to the more restricted judgment of the average
business group.

possible to the more restricted judgment of the average business group. The Division maintains its own cipping bursest, supplemented by the services of the chief commercial cipping burseau. It esties practically everything mynth bearing on any phase of reconstruction. This material is classified, indensed and ready for reference From these situages the Division assues a dayly dignet of reconstruction news intended for the Counsil and government burseaus but available to all whose reconstruction problems are such as to estible them to the service. There has been so much vagameness about the subject of reconstruction that it is refreshing to find a government activity concentrationing inself with its details in a thoroughly practical worknown and the countries of 
and a great deal of practice in the work of the Reconstruction Research Division. It is compliations and published as not expressions of opinion of some theories but means of disseminating those facts on which, and only on which, as comprehensive reconstruction plan may be

next means of dissecurinating those races on whene, and only on which, a comprehensive reconstruction plan may be bound.

One of its most elaborate pieces of work is a nevert of reconstruction activities of the world at large in which, plans and a second property. The programs we which, plans and a second property, the programs we which, plans and a second property of the plans and a second property of the second plans and plans and plans and a second property of the second plans and plans are second plans and plans are second plans. ### The Case for Water Power

### The Present Status of "White Coal" in the Eastern United States

I N the United States today there is approximately four of five times as much steam as water horn-power in use. The aggregate water hors-power, developed and endeveloped, as around 80 millions in 1916 perhaps a triffs more than one-tent bot this was developed. means that there is still undeveloped water power in the sountry equal to twice our present steam capacity Of the undeveloped water power, about three-fourths a found in 13 western states, leaving one-quarter of the total, or some 13 million horse-power, for the East

In the nation at large some 3214 million horse-power is created each year from coal—a fuel that will ultimately be exhausted Of this total by far the greater part is in the eastern states. The tremendous water-power potentialities of the Rockies are more romantic than the properties small developments into which exploitation of seators water power would of necessity fall, but in view of the figures just cited, the latter alternative is not without its attractions. Before the interest of intors can be enlisted in any project to utilise the water vestors can be enlisted in any project to utilise the water power of the East, however, certain economic and legis-lative factors which in recent years have taught the capitalist some expensive lessons must be reviewed

In the first place, drought in summer and me in winter have withheld from the water wheel a constant source of The initial cost of building dams to overcome this was so great that companies which might in the long run have succeeded were unable during their infancy to compete with the steam engine. In addition the high cost of transmission systems in mountainous regions has

been prohibitive to some degree

The total cost, in 1914, of installing hyrdoclectric
plants appears to have been about \$158 per horse-power This includes everything, from dam to distribution If coal continues to soar, in time the comparison system. If coal continues to soar, in time the comparison will be favorable to water power. At present it can only be said that increased efficiency in the operation of the hydroelectric plant might look forward to overcoming the difference. The best steam practice secures at the generator only 40 per cent of the energy showed in the coal, while the efficiency of the water wheel frequently second 90 per cent. But at the same time, the rapid

development of the steam turbine with its increased efficiency is working on the other side of the scale impor-tance in retarding water-power development. The high value of the land required in industrial districts has been a handicap In many cases railroads that follow the streams would have to be relocated in order to make arcains would have to be relocated in order to make possible a water-power development on an adequate scale. There is the great live dam in Tennessee in connection with which over a million dollars was spent in transforming railroad tracks to higher ground. Then in transvering rearrows transk to nigner ground. Then there as some rively of really first class head sites and when such a one as found, forestry laws are likely to lack adequate, provision for land leasing A legislative obstacle lies in the fact that many streams are of an interstate character, and while the experience of New York and New Jersey with the Palisade Park and the Fork and New Jersey with the l'aissade l'ark and the Hudson Tunnels proves that it is sometime possible to get the same ball through licth Houses of two States it is never a simple matter. Morrover long term franchies held by municipal heating and lighting companies frequently place new competition at a discount And there is at least one engineering obstacle in

paucity of data on the geologic features of stream beds.
The report of the Pennsylvania Water Commission for 1916 gave the harrowing details on hydroelectric projects that have been started and stopped for various Some were begun at a time when capital was notably scarce Many companies proceeded more or less by rule of thumb, without realizing the necessity for a complete survey, as a consequence poor sites were chosen that had subsequently to be abandomed. Hydrochosen that had subsequently to be abandoned. Hydrographic conditions were often overestimated, so that when it came right down to doing business the water counted on was not there. On the other hand comcounted on was not tacre. On the other hand com-mercial surveys were frequently on an even more sketchy basis so that the markets were not nearly so wide as had been autospated. In three instances uncertainty had been suitespated. In three instances uncertainty as to the lagal rights possessed by the companies blocked further progress. And of course all these known failures have introduced a big in rai hazard. In spite of all the difficulties and all the discredit

brought upon water power in general by the failure of half-baked projects and recklessly promoted schemes there has been genuise progress by wat a power through out the Last Indeed all the obstacles recited abo that can be overesme by intelligent attack They have been so overcome and on a seale sufficient to demonstrate the advantages to be reased in overcoming them

First of these is conservation of titel Second is the progress toward ultimate electrification of our railroads Most of these follow rivers for the best part of their length and have therefore this natural source of power right at hand. Then too water power makes electric lighting available wherever it is needed, which is not the case when we are confined to current produced by burning Nor is it true that introduction of water power means the chimination of coal power on the contrary where steam is already used it can be admirably supplemented with water power

plemented with water power

Advantages which accrue less directly from the
climination of fuel burning are also numerous. The
storage reservoirs in use with hydrodectric plants provide protection against floods during the wet season while in the dry period water from the impounding dama greatly improves the sanitary conditions along the stream below. In a ldition lains frequently facilitate

That the advantages of water generated power can indeed be made to outweigh the objections thereto when the final reel ming is struck is amply indicated by the showing of (ainda. The Yukon develops 97.4 per cent of its primary central coergy from water Ontario develops 957 per cent in this way in com petition with convenient and reasonably cheap coal supplies. Maint da shows a figure of 95.2 per cent Quebec 94.9. British Columbia 89.8, Alberta develops 43.2 per cent from water although an abundant supply of coal is available. In the other provinces the showing is not so good but even in Prince I dward Island 13.9 per cent of the power comes from the very limited water courses Saskatchewan is the one province where the (Cintinued on page 8)

### "Swamp Lands" in Florida

To the Editor of the Scientific American In your name of November 9th last there is an analysis along the Secretary Lane, in the course of which a tabulation is offered of the amount of swamp land in the our moue of November 9th last there is an article several states. According to this table, there are 19,800,-000 acres of such land in Florids

When a gentleman of Mr Lane s standing makes, in a When a gentleman of Mr. Lane s standing maken, in a paper of your standing, such a bald muretastament, protest is called for There is not, nor has there ever been, half that area of swamp or overflowed land in this state It is true that in 1855 the United States coded that area to the State of Florida or 'swamp and over-flowed lands,' and this is presumably where the Secretary cound the figure, but the tract cache simply did not count, as swamp or overflowed land

The site of thus town, nearly 300 feet above sea-level, with nothing that resembles swamp or overflowed land within fifteen miles, was among the lands so ceded Nearly if not quite a million acres of good land west of the

Nearly if not quite a million acres of good land west of the Appealachous River, land that is and hes always been high and dry, was included in the oceano.

The settual area of swamp and overflowed land in the State a not anoth, if any, more than one-fourth that given a fift Land's article. That in the Everghode is now being dramed, and the land is as rich as the Nide delta on these lands it is hoped to settle some at least of the returned soldiers under Scoresary Land's plan, and the Periodia legislature as its special session early in December authorisms the officials in charge of those lands to consider the state of the state of the returned lovers-meet to these and. But it is 18,00,000 sense it.

De Fundal Spiphings, Fla.

R. W. Fronze

To the Rélies of the Scinerura Americant In regic to your inquiry, you are informed that, up to June 20th, 1913, ewamp land patents were issued to the

tate of Florida for 20,201,660 52 acres under the grant made by the Act of September 28 1859 (9 Stat 519)
Of these lands, 11,630,271 51 acres were selected before March 3d 1857, and arrespective of their character as swamp or dry were confirmed to the State by the Act of

ongress approved on that date (11 Stat 251)
The total area of the State of I lorda is 47,546 240 cres, composed of \$5,111,040 acres of land and 2 435,200 norm of water

The records of this office give reason to believe that some of the lands elammed and patented as swamp, were not of that character, but no investigation has ascertained their exact area

> ( LAY | ALLMAN Communioner of the (eneral Land Office

[It seems almost unnecessary for us to comment upon the reckless manner in which, simply because it has no better figures, the Department of the Intersor hi as promulaate statistics known by st to be succered. The supposition that, even in such a watery state as Florida, over 58 per cent of the total land area could properly be classed as scamp overflowed, is all ogether an extravagant one held this correction for some weeks in an endeavor to secur held the correction for some specks in an indicator to server a reliable estimate as to the real area of resump and over-flowed land in the State, but nobody seems able to tell us, and the Commissioners a doubless right when the says that this favor has nowe been determined. This fact hard affords justification for eucletting for the true fagree or which is an undetermined number of millions of afree ou of the way — This Extract ].

### Making the Airplane "Safe?"

To the Editor of the SCHRYTFIC AMERICAN It is avident that Mr Gaetan Ajello, whose letter "How Best to Make the Afriplane 'and' appeara my your issue of Mareb 8th, 1919, has had very little practical experience of Symp As his article might discourage research in a field which will in future be of the greatest value to seronauties, I should like to point out some of

his most apparent errors
With regard to his classification of airplane accidents it is quite true that more societies have occurred at low altitude than at high ones. The vast majority of these however, have happened at training regardens or schools and have invariably been the result of inexperience on the part of the pilot. The maintenance of correct horizontal balance in landing is juriely a matter of matinct which comes as the result of experience. As a forced landing is in most cases caused by loss of

motive power it is impossible for an avictor the compolled to fly kw around the limited are in who but has picked for his landing

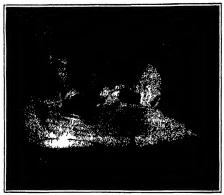

With regard to recidents at a high altitude his obser vations are entirely wreng. Accidents of this nature have three causes only breakage of some vital part of have three cluses only increased in some vivil person the fusclage or wings jambing of the outrols or a col-binum. In other of the two former cases the pilot would have time to extricate himself before the machine gained too great a velocity

The greatest value of a parachute is in the case of fire -the nightmare of every system. In the case of tractor machines it is impossible to use extinguishers as the rush of air carries the stream tway from the fire the seat of which (the carbureters usually) it is impossible to get at in most inachines. Side slipping does not blow out a fire except in very rare instances | the reason for side slipping is that it carries the flames away from pilot and that it is the most rapid method of losing Usually however if the machine is above 2 000 feet the tanks blow up before the ground can

The type of parachute that must be developed is the one which pulls the pilot out of his seat when operated, not the type in which he has to jump over the side to

open it The device your correspondent suggests to replace the parachute is rather obscure but I take it that it is type of collapsible lighting surface attached to the machine and dependent on its speed through the air for its lift. Now if this is the case it would be quite useless to prevent crashes due to loss of flying speed at low alti-tudes. For it follows that if the machine has lost speed enough to prevent its lifting surfaces generating lift there will not be sufficient speed for any auxiliary lifting surface to generate lift Again if the machine is being flown to the ground the pilot will not know until the moment of impact that he is doing anything wrong, when it would be too late for any device to work. I therefore fail to see the advantage of this device in preference to that of the parachute. The only possible use for it would be in the case of breakages or jams in the air.

Shell-shock patient in a running water bath

# Making Over the Disabled Doughboy

Apparatus Used in Our Hospitals to Restore Our Injured Soldiers By John B. Huber, AM, MD.

Photographs taken at Letterman General Hospital Presidio Nan Francisco Copyright by Underwood and Underwood

I N base hospital work while the war was on the principal thing that was watched for in every seriously injured man apart from infection was slock or collapse. The men reached the base hospital by train wenty-four the men reached the base nospital by train twenty-lour to thirty six hours after thry had been wounded. They had the most of them here long exposed to cold. Their clothes were covered with mind from the treaches numgled with their clotted blood. But bandages blood soaked or else hardened from dried blood were had been the control of t stocking in their wounds. They had been terribly jostled in transportation. Many were listless and apath it who showing their profound physical exhaustion and their shock (oftentimes worse than actual wounds). and their shock (oftentimes weree than actual wounds) from their cumulative exposure is concussion from the modern high explosives. Fine faces were drawn and punched. Hene reves were sunkn and lustrices. Their skin was cold and suffused with a chammy sweat. Their pulse was irregular weak worbbly easily compressible and the disastolic pressure taken by the aphygomanoneter was wordfully low. Hin rom intic was to sit ep. They had slept marking. They had slept fighting. They would sittle quaring main diversing and operations. But before they were allowed to slep they were given a but bath and hot soup and a very stift hypodermic instances of the superaction of the superaction of the superaction of the superaction was applied to fracture. In the most of them 24 hours later after rest and comfort their was a vast difference. The drawn and

anxious look had disappeared from their faces. In place

anxious look had disappeared from their faces. In place of a pathy they were alert and bright their color was fine their polars of good quality.

In their paties of good quality of the property of their polars of their polars of their polars. In the case of their polars war upon every quivering human nerve. Britishers upon the last lap of their rearguard actions were tired almost to death yet when they were called upon to make our last effort after an days of lighting and marching staggered up to their work like men who had been chloroformed with dayed eves gray and drawn faces speechless deaf to the words spoken to them blind to the menace about them seeningly at the last gasp of strength I obtsore and stiff limbed were such fighters feeling like old old men

-and this was to the splendid was correspondent the astounding thing—after a few days rest these beroes were young and fresh again—upon my faith it was almost impossible to believe they were the same warriors as they stood about in the evening sunshine like men on a village green taking their ease in times of peace. Their kilts were stained but they had washed off the dirt of battle, shaved cleaned their steel hats and the tiredness had gone out of their eyes and youth had come back to them Neldom indeed even in the most awful of human stresses are we left without a few ounces of latent energy upon which recuperation may be based. We have in our bodies all of us, a latent potency, our sources of mind and body, which we are able to draw on for supreme occasions are far beyond any idea the most of us have of our capabilities of the bodies are wonder-fully blessed with margins of safety over and above the maximum required by normal arivity with factors of maximum required by normal neity of the property of the factors of reasonable varactered maximum loads, but the stresses of reasonably expected maximum loads, but also those of several times such loads

also those of several times such loads to the state of the state of the state of the state of the sounder in body than both the state of the sounder in body than when they went over there by reason of the magnitures physical training they have—many of them, and so it is that Unde Sam aided so nobly by many friendly non-governmental agencies is with their bely accomplishing wonders in restoring those mained boys if not to their old shape at any rate to health and to useful vigor. Espirally must the majority of the men now in our war believed to the state of t hospitals and in our convalescent homes depend for most of their present treatment, and for their future efficiency on physico therapeutic measures—massage and passive motion, the beneficial effects of heat and light, the X-ray and electricity of baths of the baking of

Stiff limbs massaged to restore their flexibility

Straightening the stemp of a log by means of weights and massage

Subjecting a patient to the light ray treatment

joints and the straightening of stump. In due oourse come simple exercises and gymnastics, physical instruction mechanicary, eventually skilled movements games and handiratis, graduated multiral training, and so fitness for many of the occupations in which workers are now sadly inseled throughout the lingth and breadth of our land, now a secured in peace by the courage of those same disabled men and of thir glorious combability and and of third glorious combability and and of third glorious combability.

Many of the measures just mutuoned are excellently well forthin the filters of measures produced accompanying this article. The adulting effects of the hot bath for those actually abooked have been touched on the hot bath is equally ashitary in this many cases of chronic shock now under our care. So beneficient, indeed, was list formed the medical war service that ambulance trans which brought the wounded from the field stations to the base hispitals were whenever possible, hated to the temperature of the state of the s

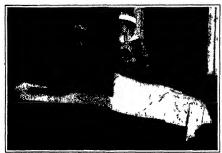

Heat in the form of auxiliarly the electro light and the baking objoints has been found most efficiencies softening up sears and other tissues, so that contractures could be manipulated and the point the most speeally is stored to its natural function. The healing expectairs of wounds was on the other with mome cases at least, shortened a fortnight by means of heliotherapy associated, of course with other measures.

Massage, begin early is most invaluable in the straighteening of stumps (in compination with aspirarities suitable to the end in visor); and in previously the permanent analysisss or immobilisation of junits by reason of adhesions, such as imast otherwise he stricthed or broken in this most painful ways if serviceable members are to be assured.

to us assured by the X-Ray has given Treatment by the X-Ray has given to deliver be introduced usually by reason of otherwise introduced usually by reason of surve fibers that have become incarcerated in any wound or operation cleatra. Such nerves are releved of compression, as the Roentgen-rays soften up the fibrous tissue Ewen deep nerve tranks feel the satistary and grasteful effects. With reput machine reactions return at the same time happily to the normal. Hers, in comewhat more detail, are the

Here, in somewhat more detail, are the plane agroved by our War Department, which defines reconstruction as complete mental and surgeal treatment carried to the point of maximum functional rostoration both mental and physical. To secure this result all methods recognised by the security of the securit

The medical treatment is not supposed to end with the physical cure Functional

Baking out stiff joints with electric heat and light

restoration is the final aim. The physical rehabilitation of deabled men is peculiarly depicted on their mental attitud. The more serious the deablity the greater the danger of mental depression and the indeposition to respond to medical and surgical featurest. There, is therefore, colucational work to be done which should begin with the soldier's arranging at the stage, where he

and the second of the second o

begins to worry about his future

This are our noble so hers taught when possible to avoil the crat he habit, and are being turned into service ble plue citizons, rather than into our lidit is to the sollars home.

### A Suitcase Motion-Picture Laboratory

THERE are times when the notion-picture man meds a small laborators equipment that he can carry about particularly when he is working in distant fields

Her tofore owing 11 the back of unitable equipment it has but in the general practice to wind the undervious I negative back to the home. Inhabition is where it could be developed in the regular way. This procedure however has a great dissolvantage namely that the cimic ramana does not know what their has him is good or not, and by the time to receive word from the home labor atory he may be too far away to shoot the some or secure were from the home labor atory he may be too far away to shoot of poor rambs the first time.

So it follows that there exists a considerable dimand for sportable aboratory. It has remained for Ridph Minoman of Los Angeles (4 — a place where almost every care is interested in motion pictures—to devise a motion picture laboratory that fits in a suitcass. Briefly, Mr. Mineman's apparatus consists of a simple print's of the continuous action design, is st of three flat pais, and a flat rack for holding the

The rigative or positive film is wound on the flat tack, which is provided with a sprintly-wound strip which serves to hold the film in place. This flat rack can be placed in the developer, here, and russer in due turn. As for the printing machine, it is simple and hand-operated a heavy flywheel providing a uniform rate of movement.

Simple printer, flat rack, and pans which form the portable laboratory equipment for the itinerant motion-picture man

# Photographing the War

Work of the Signal Corps, U. S. Army, in Recording the Pictorial History of American Military Work in France

By C. H. Claudy, Special Correspondent of the Scientific American in France

PHOTOGRAPHY has had a great part to play in the war and has been a very vital factor in almost all stary operations. The work of the agual photog unlitary operations tapher and those who develop and paint his work in data thus obtained has added a new laurel to the crown worn by Daguerre

But now that the war is over and as time heals the sears on the terrain and industry and patriotism unite to rebuild the shattered buildings photography will be longest remembered in connection with the war for its preservation of sights and scenes which must soon disappear and pass from the recollection of living men

ispusar and pass from the recollection of living men. Both French and I juglish governments have made very complete pictorial histories of their parts in the great conflict. I mixil, for both the historian and the initiary, authority the United States had in the Signal Corps an organization able to cope with the far-fluing Corps and organization able to cope with the far-fluing of photographic comparts favorably with our collection of photographic comparts favorably with control of the countries of our moune films of the war will bear varwing side by side with those of France and England, and if our midrary authorities can prove a point or build viewing side by side with those of France and England, and four military nuthorities can prove a point of build up a new science of war in the future because of the disting pictures if will be because the photographic division of Signal Corps was viry much on the job. The Inited States entered the war April 6th 1917. On July 27th of the same ever the first Signal Corps photographic absoratory was posterior in the Signal Corps photographic absoratory was posterior and in the signal Corps consisted of our officer and our private.

The I aboratory and Photographic Division as this organization is called, was formed not only to compile a organization is called, was formed not only to compile a complete pictorial history of the American participation in the war, but to assist in supplying the American periodicals with both news and propaganda pictures in this connection, it functioned through the Communities on Public Information but was in no way connected with that body except as the means of supply of the pictures which the Committee distributed

As might be expected, with the rapid growth of ship-ments of men, American participation in the war speedily demanded a much more extensive force and much larger quarters for its photographic units. So that in Febru ary 1918, with eight officers and 28 enlisted men, laboratory moved to a motion-picture plant at cennes (just beyond Paris) where more space and better equipment were available

ne work in the field was done by what were known as Photographic Units, in almost every case consisting of a commissioned officer, a sergeaut, first class, and a private, first class One such unit was attached to every division every corps and every army headquarters in France, and as many as were needed were stationed in Lugland, Italy and Russus

These units did both 'movie and still work, often

under fire, often at the front, but as well behind the lines, in the path of both advance and retreat picturing everything picturable which might be of future or was then of present interest. There has been no military

movement of any importance that has not been photographed There is no regiment which has not had its place in the pictorial files. There has been no evidence of American ingenuity in any of the sectors under American control which has not been preserved in pature form

This is the more remarkable when it is remembered that the American army officer had had no experience of Furopean war methods (Many officers of the Allies grew up with the war The American officer was pitched head-long into a full grown war. In many cases he did not appreciate what pictures might in an and not infre-quently the Photographic Unit had to fight both red taps and an old-fashioned until that pictures were of

no importance
The photographic units were a mposed of trained photographers, men who knew cuncias and camera work and often, as well, men who knew pictures from both the pictorial and the news side. The result has

Fliming a truck train unloading troops

been a really wonderful collection of pictures, how wonderful no one in America really knows both because of a lack of adequate distribution machinery for pictures at home, and because of the absence at the present moment, of any legal method by which these photographs can be made available to the American public, of which

can be made available to the American public, of which anamolous studente more in a moment. The photographic units had or asconally some atrange orders to deal with from sevir i hair officers at home, as in the case of the photographic who was solemnly assured at Washington that the engineer, having lumber, would be glad to build hims a platform to one side of a good more view of an attackfull count he might get a good more view of an attackful.

This sounds flumy, looking at it from a close view of the buttlefield. but it is nothing like as humerous as that

battlefield, but it is nothing like as humcrous as that who made written r equest for a picture of a battle

with ioriam specified objects much desired to illustrate a lecture-room point. They included a river in the forseround, with troops crossing it under fire, a battery to the left, in action, protecting said troops, and the Bocher retreating in the background.

If, however, the photographic officers and their me did not exactly get platforms exceted from which to make movies of the battle in progress, they did, more than moves of the battle in progress, they did, more than moves of the battle in progress, they did, more than to stick anything like a moving picture machine over its present the present of machine gun builded. The movie was anything the moving picture machine over the contract of the properties of the properties of the properties to these ounded, which is well in proportion to those other casualities of the fighting forces, company with the number of men from which forces, compared with the number of men from which

At the present time the Photographic Division con-sists of fifty-four officers and 418 enlisted men and cierks By no means is the work all finished, and much that could be obtained during the combat has been made available since, and positions towns, formations, defenses, etc., are still being photographed. So far the Photoetc, are still being photographed. So far the Photographic Division has developed 36,574 still negatives and 594,277 feet of original moving picture negatives. These negatives of both classes are filed and indexed in such a way that any one can be found at almost a moment a notice For instance, if some one wants to know what the second company of the sixth regiment of Marines did on such and such a date, and a picture we made at that time, it can be found, instantly Or some one wants to know what the town of Ltain looked ike on a cream date it and be found. If any portrait as wanted it is findable instantly, if it exists. In other words everything is cross-indexed and up-to-date so that there is no time lost in getting at the existing picture when it is not the contraction. when it is wanted

Somewhat the same system exists with regard to the moving picture negatives. They are in small sections, of course but so classified that on demand any variety of film can be made up Thus, an artillery authority can have one showing only artillery work, or a medical officer can have one showing only hospital work, or an 5 O S may get a movie film of any number of reels he pleases devoted entirely to transportation or any other subject, morely by specifying what he wants in addition to making and classifying these films, the

Photographic Division has turned out fourteen 1,000-foot reels under the title "A L F Weekly which are shown to rets under the title "A E. F Westly winch are above a dollars all over France, this keeping the rank and file solders all over France, this keeping the rank and file doug, and five 1,000-foot reals called the "S O B Westly for display at the various base ports—it was also used in "The Race to Berlin." Many special feature films have been made, showing also the bustories of the various staff corps in the A E. F. Of the organization of the laboratory it is unnecessary.

to speak except to say that it gets things done A personal visit to the laboratory shows a set of soldiers who apparently thoroughly enjoy their work, and who have

A group of workers in the cutting room

quarters, food and shelter close to the laboratory which are more than comfortable. The laboratory itself works under high pressure and turns out prints and films red by military authority with surprising speed, but with due regard to photographic permanent

but with dus regard to photographic permanence
Mention was made of the ourseus fact that there is no
way by which the American public can get at these
photographic records. Thus is no cone's fault, apparently, but simply a lapse or gap between the cossistion of
timer'n of the Committee on Public Information, which
body formerly distributed the war pictures each it by the
flignal Corps, and the creation of some new darthuition
machinery. It is illegal for the United blates army to
sell its promerty, and it is certainly littless for it, to give it. sell its property, and it is equally illegal for it to give it away Photographs here available can only be put forth

The gun camera in its perfected form weighs only 13 nounds in all, and has a lens barrel but 8 inches long and 21/2 mehes in diameter It is of metal construction throughout The film magazine is oval shaped It is fitted with a Lewis gun magazine lock, which serves to

nation with a Lewis gui magazine loos, which serves to Soon after the gun earn ra was introduced arguments arous at the traming fields as to which avator first shot the other, when both showd hits on their film. I has necessitated the introduction of some form of time indicator At present the gun camera in photographing

Indicator At present the gun camera in processing as hit also registers the time on the same image.

It was believed at first that the aiming of the gun camera would have to be done mechanically and one had visions of intricate gours and other mechanism

But the problem of anning was solved by a system of mirrore

The gun can registered with relation to the mehts of the muchine gun to which it is attached by first mighting the machine gun on a point a definite distance away and then moving the camera so that the point of the bisecting lines of the graticule fall chactly on the point where able clamping members then it suit the accuracy of aim

In place of the explosive lorce of the usual cartridge, something had to be introduced in the gun camera for driving the mechanism The designers in the present and but at model have made use of a spring which is wound with a handle similar to that

545

TOPOGRAPHICALLY States Island belongs to New Jersey On the north and west it is embiased within the arms of the nighboring state, being separated from it only by the channel of Kill van Kull barely a quarter of a mile wid and the still narrower Arthur Kill The island hes more than five rules from Manhattan and its pearest approach to the rest of the State of which it is a part is at lord Wadsworth where a full mile of water separates it from Bay Ridge At their most constricted separates it from Bay Ridge. At their most constricted part the Narrows are wider than the widest part of the part the Narrows are wider than the whorse part and Hudson River So that in every was Staten Island is disconnected from the other bornighs of Greater New And yet it is a part of the big city and sh tork And yes a so a part of the apoletin sust facilities which have been developed to such in extensive digreem all the rest of the boroughs. At present the only way reaching Staten Island from Manhattan or Brooklyn is by ferry and in foggy weather when asvigation is slow if not positively dangerous. Staten Islanders feel their remoteness from the heart of New York During the recent ferry strikes the complete isolation of States Island then threatened showed the imperative necessity

of tunnel or bridge connection with the rest of the city When the Brooklyn Lourth Avenue subway was projected plans were made to run a line across the lower end of New York Bay to Staten Island. This would urvolve a tunnel some (w) miles in length for it would har ily be practicable to tunnel under the Narrows at their narrowest point because if the depth of water there. This ext usion if the Lourth Avenue subway has not yet been built although the rest of New York has been widely extending its subways and alcosted lines the meantone Staten Island with its excellent frontage of deep water for shipping and its vast acreage of un peopled land has remained undeveloped while its citizens have been paying increased taxes to increase the borrowing capacity of New York and help it pay its rapid transit Hader these conditions it is very natural for Staten Islanders to sturt an agitation aiming to extend rapid transit facilities to their own portion of the city.

They are a decontent to be connected to

Brooklyn feeling that this would be an indirect way of reaching the heart of the city. Brooklyn rapid transit lines are already congested and would hardly furnish the acc sour bechines for ad litt till passeng r s rvi e to and from Staten Isla L The trip to Manhattan Is was of the Louth Avenue subway considering the fact that stops would buye to be made through Brooklyn would probably take longer than the present ferry 11 h direct from the foot of Manhati ii Islaud It has therefore, been proposed that a direct line bu run from St George States Island to the Battery Manhatt m

Various views of the camera gun as well as a sample exposure made on the film

for official purposes! Inasmuch as one of the reasons why they were made was to show America what her sons did and how they America what no sons do and now did it, this is a condition which should be, and doubtless will be, changed as soon as Congress is shown that a law to permit size permanant form of distribution at ocat of prints, is a necessity

Eventually, of course, all these still and

moving picture negatives will be brought to Washington and there kept on file Long

to Washington and there kept on file Long before that happens, a united protect to Congress on the part of all interested—and that means every illustrated periodical and every ollector, every parent of every soldier and every library, museum and school in the nation—should get the necessary legal steps taken to make available to the whole of America, America s pirtured participation in the great war.

### Making the Machine Gun Shoot Pictures in Place of Bullets

N casting about for a suitable method of training aviators in serial marksmanship, it was the British who first introduced the se-called gun camera. This device in its early form was simply a camera patterned after a Lewis gun, with a long lens barrel in place of the al barrel. The gun camera was then a cumbersome trivance, its operation did not aimulate that of a numel barrel genuine Lewis gun, it carried plates for 12 exposures only; and each exposure called for a manual operation

only; and such exposure called for a manual operation. Them the United States enserted the war, and among other things the matter of a satisfactory gun camera came up in due course. As a raw pob, the British gun camera was not at all hed; but after a while the American camera camera cases forth with an idea for making the gun camera was not at all hed; but after a while the American camera c

employed in winding phonograph in items. The spring is fastened directly to the shaft that turns the five-inch real and through to the Geneva cross movement which causes the intermittent action of the shutter and film-shifting mechanism, each time the gun is fired. The film sinfutur mechanism, each time the guine fired. The film is standard motion-posture as it as and un the guine camera it travels from a spool in the small end of the magazine has a light trap where it is exposed and three to a red five inches in diameter at the larger end of the magazine where it is stored until developed. Back guine sames a so ordinarily provided with three magazines which may be louded in daylights.

The 'hits are recorded on the motion picture this in the form shown in the similar of the accompanying dilustrations. The dressed lims serve to indicate the socuracy of aim with relation to the carplane photographed, the white slock did indicates the exact time serve down to the second. A glass plate called a 'grati-

magnetic, now waite surest did indicates the exact time even down to the smoond. A glass plate called a "grati-cule" is metroosed in the lens-harri at the focal plane of the lens, which missage practically in contact with the film. The graticule carries the grown d hors and circle, which are photographed in such image recorded. The developed images serve to indicate whether a given "shot would have proved vital or ret u actual sombat.

Details of the guz camers are green in the accom-

Access to the gan camert are given in the accom-panying enjarvassa. The picture on the right is a re-production of a photograph snapp d with this appearatus, showing that the guanter just missed the chasms of his opponent and that the "abot" was fired at 10 48

Our front-page illustration shows some of the various proposed routes. Route A is a tunnel extending from the Battery to Flus Island, and thouse to Staten Island This would connect with the Seventh Avenue subway line, so that 'staten Island would be brought into close touch with the business part of New York, and also with the theater district. This would have the advantage also, of providing direct tube connection between New York and Ellis Island, and a separate tunnel could be run over to Communipaw to connect with the Jersey Central lines, which now have no tube connection with New

Nearly three-fourths of all the boxes crates crating etc, are manufactured in the region east of the Missussuppi River and north of I cancesee and North C arolina which owing to the extent of its industries offers the best market for boxes, and also embraces or is contiguous to the sources of the woods most used in hox making

### What is a Good Box?

A properly designed packing box is one which has enough strength in each part for the purpose for which it is intended and no more strength in any part than is necessary to balance the average strength in every other packing the part of the data necessary for designing such a box cannot be obtained from observation of boxes in actual

One test that the packing case has to withstand before it receives the official sanction

A poorly made wooden box after shipment by express and parcel post

frequently bears evidence in itself of the cause of the damage, but there is no way of detarmining from a study of the failure the amount of force exerted by the damaging cause and in cases where several causes have been active it is impossible to identify each of them. On the other hand, laboratory studies (made at the Forest Products Laboratory, conducted by the Forest Service at Madsion Wis, in cooperation with the University of Wisconsin) combine practical experience with it is knowledge of the designs in use, of what lumber is available and of hox factory practice, with accurate securite test made on the package itself, packed as in actual service and subjected to strains that approximate actual transportation conditions.

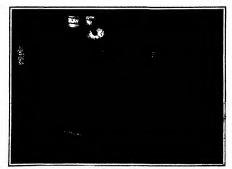

approximate actual transportation conditions. Compression-long-an-deg test, as its name implies, is a steady and constantly increasing pressure (measured in pounds) applied along any edge and with the opposite edge diagonally through the box in a direct line with the researce extend the corner-wise test is applied in the sameway to any corner of the package with the opposite corner in a direct line with the pressure. These two tests measure the strength of the box in withstanding any external pressure and to a limit of extent approximate the hazard of the lower tors of boxs in a pile. By them selves these tests are insufficient to determine comparative weaknesses in the various factors that enter into properly balanced construction.

Another very good test is the drop test, especially for comparing the strength of one how with that of another In this test the box is packed with the actual contents as in service and dropped from a predetermined height directly on the corner which is a fall that occurs in actual service. The value of the conclusions in any runs so rapidly into another that the observer does not always get the true measure of the weaknesses.

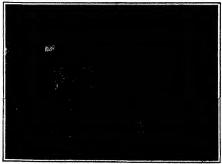

The most practical method yet devised for testing paking boxes is the revolving drum test. The drum is a hexagon-aided machine and revolves slowly. The box to be tested is packed with the actual contents, as in commercial service and placed in this drum. In drum, are arranged a series of haards, which cause the box to follow a regular cycle of drops, falling upon the side top, bottom, ends, edges corners, and flat wise upon a propertion similar to the corner of another box. These drops simulate the usual haards of transportation, excepting the heavy static pressure received by a box in the lower titer of a pile which is setured by means of the compression-on-edge test described slows.

As the box moves on from one drop to the next the observer notes the beginning of the failure of the weakest point in its construction and follows the development of that weakness until the box entirely fails and lets its contents out.

The weak feature of the box may be too few nais, nais of too short a length nais driven in a crack and thus having no great holding power, or some other form of nail failure and the tests clearly show this weakiness. The material in the sides top, or bottom may be too thin so that the shocks of the falls pull the wood from the state of the s

### The Cockpit of the Transatiantic Seaplanes

ANY landsman who may have been so fortunate as to be admitted to the chart-room and shown the method by chart-room and snown the method by which the ship in which he is voyaging is navigated, particularly if this should happen in foggy weather, will quickly understand some of the difficulties and anxieties of the art of navigation. The writer well remembers such an experience on a run from St Johns Newfoundland to Nova Scotia, when a dense fog slut down on the little vessel two hours out of port and never lifted throughout the voyage The sole means of navigation was the small shells, grains of sand and bits of gravel brought up from the ocean bottom by the Thompson Sounding Machine Comparison of this material with an excellent chart of the ocean bottom, several hundred fathoms below, served to bring us snugly into the harbor of Sydney, Cape Breton It is needless to say that the Thompson Sounding Machine was kept going throughout the greater part of the voyage of nearly 400 miles

But if the navigation of the sea is diffi cult, that of the air is far more so Fog is an even more baffling enemy to the navigator of the air than it is to his brother of the sea Thompson Sounding Machine for his guidance

even if he were able to plumb to the ocean a bottom Furthermore, should there be a combination of wind and fog, the problem for the air-man becomes utterly and log, the pronoun for the air-man becomes arterly bewildering A wind blowing from the north aiross the path of an air-man who is specding east will of course carry him to the south. If his speed were say sixty an hour and the wind speed as in the case of whole gale, were also sixty inlies an hour, instead of his course lying east, it would be southeast. In clear weather and by day he would be able to judge roughly the direction and speed of the wind by observing the direction in which the waves were running. But if he is enveloped in fog he has absolutely no means of determining either the direction or velocity of the wind, or indeed whether there is any wind at all

Chere

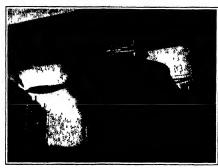

In spite of the fact that dreadnoughts and destroyers of the United States Navy have been stationed at intervals of 50 miles, it must not be supposed that the task of vals of 50 miles, it must not be supposed that the task of flying across the Atlantic even with all the resources of the Navy enlisted in the entriprise is an absolutely simple and sure thing. If a day is selected for the flight in which there is a combination of light winds, absence of fog and generally clear weather, the problem resolves itself down to a question of motive power. If the liberty motors are capable of running continuously for 20 hours there is no reason why all three machines should not make the flight from Newfoundland to Azores without alighting. But if they meet with fog or winds blowing ahead or aheam, the actual distance that they will travel through the air, even if they hold a true course, across the ocean, will be greater and the possibility of one or more of the engines giving out or of the oil supply running short will be in reassed. A forced landing on the water would involve some risk, especially in a wind and

The Navy Department has announced that the navigator of these Navy planes will be assisted by several new navigational instruments which have

heen designed particularly for this kind of work. There is, for instance, the aerusl sextant named after its inventor, Lieuten ant-Commander H. L. Byrd, in which a bubble in a tube takes the place of the sea hormon, a substitution, the value of which normon, a substitution; the value of winds will be appreciated at once by sulyone who has done any air navigation. Often when flying at low air tutudes the horizon is too dian to be clearly seen, and of course when one is above the clouds it is frequently

impossible to see any horizon whatsoever. The navigator will have with him also in his cockpit a projection chart of the Atlantic Ocean, which does away with much of the former mathematical calcula tions and enables the aviator to fix his position in a few minutes' time

The most important aid among the new matruments is the drift indicator which is shown in the accompanying photograph of the cockput of one of the great Navy saplanes. Behind it is standing Leutenant-Commander Byrd The object of this instrument is to enable the navigator to calculate the speed and direction of the

would be sufficient in calm weather or if the winds were coming from dead ahead or dead astern of the ship but if the wind is on the beam the craft even though she were pointing correctly on her cours so far ntinued in pag 60

# Caining Flying Experience Without Leaving the Ground

TIHIN the past f w months there has been perfected an apparatus whereby flying cade a may acquire flying Capcinnee without leaving the ground is the invention of William G. Ruggles of New York City and serves to familianze the beginner with the various loops turns nose dives and so on experienced in trick or combat flying

The Orientator is based on a modifica-tion of the old fashioned universal joint being composed of three concentric rings so prvoted together as to permit the fusciage member which is pivoted within the inner most ring to be put through every possible dution experienced in actual flying Thus the apparatus becomes practically an airplane as far as training is concerned

The cadet sits in the fuseinge and by means of the joystick and rudder controls puts himself through practically all the evolu tions which he is later to experience in the air

Small high speed electric geared motors through high reduction gears to the various parts of the Orientator furnish the power for the evolutions. The joystick and rudder controls close the necessary contacts for the various motors Bi cause of the high-spied motors and great gear reduction the action of the apparatus is prompt and

DONILIVE An analysis of the crash reports from flying schools has shown that a remarkably large number are solely due to a failure to come out of the spinning nosi dive or tight spiral. The only reason that the callet has failed become accustomed to these unusual movements These evolutions stimulate the internal cars which send these evolutions arimulate the farther ears which send nervy impulses to the brain. The individual has no con-trol over these impulses the only thing he can do is to learn the significance of these impulses by experience. The problem is extra mely simple. All that is needed in The problem is extremely simple. All that is needed is that every eader should fly the Orientator day after day until he is entirely familiar with these new sensations Any mistake that he makes causes him no harm because he never leaves the ground. He is then prepared to undertake stunting in the air. Flying training on this ground training inseline should be under the combined supervision of the officer in charge of flying and the flight with the com-

### A Substitute for Linseed Oil in Sweden

NEDISH engineer has succeeded in obtaining a A substitute f r inseed oil from purely Swedish raw materials according to a report published in the Journal of the Swedish Chamber of Commerce in the United Lingdom. The substitute is said to possess all the good qualities of the kenume article. The invention which is the result of long and patent work has been bought and the result of long and pattent work may occur brough a will be exploited by Director 1. Schelin of Stockholm manufacture would have been legun long ago, but for 2-2-x in delivering the necessary machines. The main delix in delivering the necessary machines. The main

is cheap to manufacture and does not need an extensive plant the cost of a factory capalle of turning out 500 tons annually not hing more than 20 000 crowns (\$5,300 at normal exchange). The price of the no muliactured article is very low compared with that of lineed oil

### New Styles in Rivets

IN speeding up our in dustrial machinery to the penit where it would supplement most effer tively the efforts of our military to strat the Hun there was no detail too small for the attention of our enginers I ven sin h an apparently trivial con aderation us the best shape for a rivet got its share of careful discussion mare or carvill distunced. To the layman it might seem that a river which is going to be heated red bot and then prunded into place might equally and indifferently be any shape.

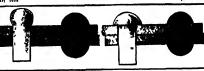

The automatic governor for chemical reactions, which regulates exactly the proportions of a mixture

at all that the process of beating ind pounding would make it fill the hole. But this is not the fact. The ordinary rives has a browled head on one end and is headed only on the other life; going into the hole

The rivet with unfinished head simplifies

Showing how a propared rivet hand (right) fails to fill hole, while one shaped by the riveter (left) is an airtight fit

The flow of metal from this second ind fills that side of the hole all right enough, but on the side of the prepared head, from which there is no flow of metal, there is a tendency for the hole to remain not quite filled, as indi-

d in our stat. He the efficiency mas who responsibility for the production of our yards proceeded to design a rivet which of fill the hole completely under the had responsibility for the production of our shipyared proceeded to design a river which would fill its hade completely under the gentle marristens of the meature. The result is a revet which has, on its prepared upper end, and ye seeped to has been seen to from falling through the hole and out the other and when the sin nearest most her rivering gust pot mits seelin sugard a principle of the hole, and the hole is accordingly filled tight. Herotofore, in large constructional work, it has been necessary to ream the ravet holes so and to have a perfect file for the rivet. With the bulls-head rivets such precautions will not be necessary because the rivet will be made to fit perfectly by the pounding of the riveting gust.

pounding of the rivoting gun

Another interesting development in
rivoting science is seen as a natural con-10000 a revenue as seen as a new started escape of the Rivets on the Sambed sequence of the Rivets on the Sambed and asset of the Rivets on the Sambed and asset, so under the old system it was necessary to early in stock a variety of revets. Now however, the only thing the the mass of the shank, for with the head formed during the process of driving the rivet, the single shape illustrated takes care of all demands

### A Sut of Armor for the Tire

THI RI is a certain type of inventor who is never satisfied that the current way of doing anything is the best and who is continually devising what appeals to him as new and improved ways of meeting old and familiar problems. And one of the most fertile fields for such a pacumatic tire for tires will wear out in spote of everything that we can out in spite of everytting that we can do about it sud the problem of the traffic man is to make them went no long as possible. It is too tires will slip especially when we put them on heavy automotiv velucles so in the to produce a tire that will wear and that won t ship.

Of course within the limits of the rub Of course within the limits of the rub bet tire it can be done the non-slipping feature has to be uncorporated from with our in this shop of chains or offin tackle of some soft. On the whole we believe that the chain of standing type has been found about as satisfactors as any other means of chimnating skidding but or casomally one of the thronically dissatisfied inventors comes along with something that is at least good enough to prevent us from dismissing it with a laugh or a strug of the sheulders or a significant tapping of our collective for

We illustrate the latest thing of this sort to come under our observation It is really what our title implies—and not merely armor, but chain armor as well for it is flexible and is wrapped around the tire much as a medieval warnor might have wrapped a shirt of mail about his anatomy if that is the

This armor in the present case is made up of rectangular sections of the toughkind of fabric bearing a series of circular iron plates as illustrated Lach of these sections is hitched to its neighbor by means of the bttle square-round bak shown, in our lower left-hand cut wired to the end of the section for shipment It will be realized that when two adjoin ing sections are hooked together with one of these at each side and then subjected to a strain that tends to pull them apart they cannot yield to that strain-without breaking the buk. The whole chain of scations is thus put together and wrapped about the tire and the final joint is made with a little tool as shown in the upper one of our three pictures. Then the tire one of our three pictures looks as at the lower right a surface that makes skidding unlikely to say the least

The conspicuous advantage of this outfit is that when as happens to every anti-skid device sooner or later, one of the sections gets worn out smooth if can be removed and replaced without any effect upon the rest of the protector without any cost except that of a nev section Then the tightening links by means of which the thing is clamped on the tare make it possible to put the protector on or the it off without deflating the tire and at the same time to keep the protector tight under all conditions. I maily made in sections as it expels mud water sand an l gravel through the openings between the sections and so keeps itself and casing comparatively clean and dry, but while doing this, it covers one igh of the tire surface to constitute excellent protection against puncture and blow-out and other hasards

Patting on the tire protected

Sectional protector for the tire showing a single unit and assembled protector

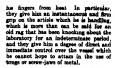

THI laboratory worker is frequently confronted with a situation in which he has to handle with his hands a tube or retort containing a boiling liquid Naturally this is not to be done without precautions of some sort, but the pre-caution ordinarily employed is usually a caution ordinarily employed is usually a makeshift of some sort. A scrap of waste the corner of an apron, or some other fragment is allowed to act as buffer between the hot glass and the flesh. Our

A French suggestion for handling hot mixtures in the laboratory

Parisian contemporary, La Nature, illustrates a very handy little device in-tended to replace this more or less undesigned for the purpose in question.

The putture is self-explanatory, and it is obvious that these little finger-stalls of subber are less conductive of heat, less liable to leave a portion of the finger un-protected and altogether more workable than the hit or-mus methods which the chemist employs every day to insulate

# Heating Water by Means of Electrolysis

THE heating of water by electrical methods has hitherto been attended with no great measure of commercial success, partly because the apparatus has been too cumbersome and complicated, according to a German electrical engineer And to prove his assertions he has devised two ingenious systems of he has devised two ingenious systems of heating to boling any required amount of water. In atther case is any special heating element required, the water taken forms the electrolyte. Briefly, the apparatus consists of two or more plates our cylinders, which are autably arranged beside one another and form the ele-

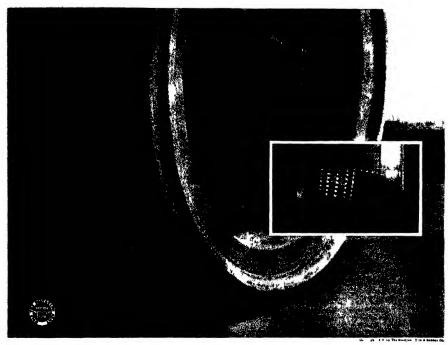

The simpler form of heating apparatus The simpler form of heating apparatus is shown at the right of the accompanying engraving. Three carbon plates, A B C are used, about eight inches square, arranged in parallel to one another at a distance of 0.4 inch or 0.6 inch, and condistance of 0.4 inch or 0.6 inch, and connected together by an insulated boit D. The plates are also separated by insulating rollers. The rods A\* B\* C\* serve for introducing the current. The apparatus is intended for three-phase alternating current, and can be regulated by outting off one of the three phases. The apparatus is directly not one of the other phases. current, and can be regulated by conoff one of the three phases. The apperatus is dipped into the water which to be boiled, and can be used on any
with any current. The carvoltage or with any current. The car-bons will last for an indefinite time, and bons will last for an indefinite time, and as no heating element is required, con-sisting of couls and the like, repairs are likely to be negligible. The apparatus is always ready for use and is quite as efficient as anything else on the market for a similar purpose, seconding to its German inventor.

It is said that carbon is the only sub-stance that can be used for the plates, because metallic plates soon disintegrate occases measure peaces soon distinueurate and oxidise. Zinc plates become covered with oxide and carbonate, copper, tin, iron and nickel are equally unstatable

with occue and carconase, copper, tim, or man and nicks are squally mentalities of the control o conducted in winter when the condition were uniavorable, in summer there is lose from radiation. Two systems of heating water by electrolysis, which have recently been washed out in Germany

"FIVE Goodyear Solid Tires, which have passed the 50 000-mile mark on one of I our trucks, undoubtedly will last another year and give us a total of 75 000 miles of continuous service. Their treads are still 1½ inches thick. Due to an accident the sixth tire in the set had to be removed at 50,000 miles otherwise it too unquestionably would be delivering like the other five today. Our experience with Goodyear Solid Tires makes it easy for us to realize why so many truck owners specify Goodyear: "—J J Callahan, Local Menager, John Wood Manufacturing Company Brooklyn New York

Thus far a total of 300,000 miles of service have been delivered by the set of six Goodyear Solid Tires described above

Yet it is apparent that even this extraordinary figure will be increased because the present condition of five of these tires indicates that each will run 75 000 miles—the sixth having been injured as the result of a collision

When the un-retouched photograph above was taken, all five Goodyear Solid Tires had traveled 50,000 miles and still all were as smooth and thick with rubber as the two shown here

Although these Goodyear Solid Tires have consistently carried heavy loads of boilers and tanks over cobblestone

pavements and into plumbers scrap strewn storage yards, they offer little evidence of having done so much hard

Certainly the appearance of the veterans affords visual proof of their freedom from chipping and shredding, a feature broadly noted in Goodyear Solid Tires

While the mileag given here is unusual it is well to observe that it has been equaled and even surpassed by other users of these sta warts

Thur reports of high average scores plainly show what Goodyear Solid Tires plus intelligent care can do and thus draw important attention to the effectiveness of Goodyear methods of solid tire manufacture

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

# One Fulton—Then Three More

Four Fulton Trucks are handling transportation for Wm  $\,G\,$  Dann, Ice and Hauling Contractor of East Orange  $\,N\,$  J

Every one of these sturdy Fultons is averaging under all road and load conditions 12 to 14 miles to the gallon of gasoline

It was their speedy, economical delivery of dependable power, whether in gruelling hill work or along level roads, that was responsible for this contractor s first Fulton Truck being joined by three more Fultons within a year—again proving Fulton to be "the repeat order truck"

And it is this dependable low cost delivery, likewise, that has placed Fultons in the fleets of such great national concerns as Standard Oil Co, Pittsburgh Plate Glass Co Borden Farm Products Co, Inc Texas Oil Co John Wanamaker Walvoline Oil Co, etc

Do you know the Triple Heated-Gas riotor? It is an exclusive Fulton feature—an important factor in the recognized economy and power of Fulton trucks

Fulton efficiency is continuingly shown in reports of I ulton Users
